# GETTING STARTED

## About the Junior Duck Stamp Conservation and Design Program

The purpose of the Junior Duck Stamp Conservation and Design Program (Junior Duck Stamp) is to "teach conservation through the arts." The Junior Duck Stamp Program provides students with a broad exposure to migratory waterfowl and other migratory birds; includes lessons to help increase students' knowledge and appreciation of migratory birds and; provides activities geared to motivating students to take on active roles in conserving these species.

Initiated in 1989, the original Junior Duck Stamp education curriculum focused exclusively on waterfowl and the popular Junior Duck Stamp Art Contest provided an opportunity for students in grades K-12 to participate in a nationwide waterfowl arts competition. While the format of the Junior Duck Stamp Art Contest remains the same, the Junior Duck Stamp educational curriculum has been expanded to provide an orientation on all migratory birds, including waterfowl, songbirds, shorebirds, and raptors. However, the emphasis of the curriculum remains on migratory waterfowl, to support students' participation in the Junior Duck Stamp Art Contest.

*Art by M. Defabritius*

### An Art-based Education Program

The Junior Duck Stamp curriculum retains the original focus as an arts-based educational program. Many of the curriculum's exercises in observation encourage students to interpret the natural world through artistic expression. This focus is based on the theory that students will be more inclined to conserve and protect what they love. An emphasis on "nature journals" provides students with opportunities to sharpen observation skills and to record these observations on a continual basis. The Waterfowl Journal Project provides students with an intense experience in the observation and study of one waterfowl species.

*Art by K. Benoit*

Many other activities contained in the Junior Duck Stamp curriculum provide students with opportunities to learn about migratory birds; the mysteries of migration; requirements for adequate habitat along with the ways they can help conserve these species in their own back yards, school yards, and neighborhoods. By providing a basis for participation in the Junior Duck Stamp Art

Contest, the curriculum encourages students to move beyond simply "learning about" wildlife and wildlife art to testing their abilities as wildlife artists. Arts-education objectives and methods for evaluation are provided for each activity to help teachers identify which activities will satisfy arts-education requirements. Students demonstrate their learning through the range of visual, dance, musical, dramatic, and language arts.

## Linking the Arts and Sciences

The Junior Duck Stamp curriculum incorporates a strong base in science education. Education about waterfowl and other migratory birds provides an overall theme with which to teach environmental science concepts including biodiversity protection, ecosystem management, species recovery, and international wildlife conservation. The lessons also include opportunities for students to improve their science and art process skills, including observation, data gathering and interpretation, creative and critical thinking, problem solving, and artistic expression. The integration of science and conservation concepts with these important process skills provides the basis for fostering artistic and environmental literacy. As such, the Junior Duck Stamp curriculum truly links the arts and sciences in order to provide students with the knowledge and skills required for an active environmental citizenry.

## Multiple Intelligence

By offering opportunities to learn about migratory birds and conservation through all of the art sub-disciplines - visual, dance, dramatic, musical, and language arts - the Junior Duck Stamp curriculum supports the current "multiple intelligence" theory of education. The multiple intelligence, or "whole brain" learning theory, supports the left brain/right brain model for learning in which the creative, intuitive, holistic, visual, and playful right brain is engaged with the logical, systematic, linear, verbal, and judgmental left brain. Multiple intelligence theory encourages practitioners to develop activities that engage all of the senses in order to stimulate each of the following eight areas.

1. Verbal and linguistic - dealing with words and language, both written and spoken.
2. Logical and mathematical - dealing with inductive and deductive thinking, numbers, abstract patterns and the ability to reason.
3. Musical - dealing with the ability to recognize tonal patterns, pitch, melody, rhythms, and tone.
4. Kinesthetic - dealing with the ability to use the body skillfully and to handle objects adroitly.
5. Visual and spatial - dealing with the sense of sight and ability to visualize including creating mental images, thinking visually, and having a keen sense of observation.
6. Interpersonal - dealing with a person's ability to understand work, and communicate with people and maintain relationships.
7. Intra personal - dealing with self-knowledge, sensitivity to one's own values, purpose, feelings.
8. Naturalist - dealing with experiences in the great outdoors

As you review the contents of the curriculum, you will note that specific activities target each of the eight skill areas. As you plan your Junior Duck Stamp unit, we encourage you to identify a range of activities that address each skill area.

## Suggested General Resources to Help Teach Your Junior Duck Stamp Unit

- Field guides appropriate for your region of the country.
- Audiotapes of waterfowl calls and bird songs common to your area.
- Prints, books, journals, or magazines of famous works of bird and wildlife art.
- Prints, posters, books, journals, and magazines containing photographs of birds.
- Single species bird slides.
- Videos on bird migration.
- Bird mounts and study skins.
- Binoculars.

# ART FOR CONSERVATION

Birds have inspired art throughout the historical record and in cultures the world over. Birds can be found in the cave Paleolithic paintings; the art of ancient Egyptians, Greeks, and Romans, the art of medieval Christians, straight through to the paintings of renaissance and impressionistic artists. In more recent history, birds dominated the art of early American naturalist-wildlife artists, including Alexander Wilson and John James Audubon. Today the paintings of Roger Tory Peterson and Robert Bateman continue to dominate the wildlife art scene.

Birds can also be found in the art of cultures from around the world. Birds figure prominently in Mayan and Aztec religious ceremonies and artifacts. In Native American crafts such as drums, pipes, and rugs, and in the totems of Haida and Eskimo, as well as the Aboriginal Australian cultures. Among Northwest Coast Indians, the raven is the creator of the world. In American folk art, birds are represented in many diverse media including quilts, cross-stitch samplers, cuckoo clocks, and weather vanes. Today, the bird and wildlife art industry represents a huge and growing business that contributes large sums to the United States economy.

It is no wonder birds are found in such a varied and diverse array of art. Birds' freedom of flight has inspired a sense of wonder among peoples from around the world and throughout the centuries. For a growing number of children living in urban areas, birds may be the only form of wildlife they see - offering a rare and important connection to the natural world.

The arts-based activities contained in the Junior Duck Stamp curriculum are geared to helping children appreciate the natural world. The activities contained in the Art for Conservation section will help achieve the following objectives:

- enhance students' observational skills;
- introduce students to sketching in the field;
- expose students to basic bird drawing techniques;
- allow students to explore the world of birds in art.

*Art by J. Henkel*

*Art by L. Fraumeni*

## Field Journals

**Grades:** Primary, Middle, and Secondary

**Objectives:** As a result of completing this activity, students will develop field sketching technique using pencil and charcoal (ART), and sharpen skills of observation of the living and nonliving environment (SCIENCE).

**Materials:**

- unlined notebooks for journals
- pens, pencils, charcoal sticks
- binoculars and field guides (optional)
- bird slides, projector and screen (optional)

### Activity I: Field Journal Technique

1) Introduce field journal keeping by having students first work in the classroom. Practice gesture sketching in quick, timed (5-30 second) sketches of stationary objects.

2) A further exercise leading to wild bird sketching includes quick behavioral sketches at bird feeding stations. Your school may have a station already, or you may wish to set up a station for your class. Sketching from slides and videotapes also can give students good practice.

3) Pure contour sketching is another technique that emphasizes observation. Start by sketching hand-held objects while looking only at the object, not at all at the paper, and drawing one continuous line for the entire sketch. Process should be emphasized over product in the practice of field sketching. Students may gradually modify the technique, peeking at the paper, so that they are looking at the object being sketched 75% of the time, and their paper 25% of the time.

Art by M.Conron

4) Introduce students to their journals by providing blank notebooks. Ask them to note at the top of the first page the date, time, location, weather conditions, and any background sounds they hear (natural or man-made). Students will include this information on every new entry to the journals.

5) If possible, take your class outside if birds are present. Have students develop quick sketches of three to five different bird species before settling in on their species of choice. Encourage students to develop quick, simple sketches using the following beginning techniques for drawing birds:

- start by drawing two circles - one for the body and one for the head;
- notice the size and position of the head relative to the body before starting;
- add the tail, beak and legs. Finally, fill in the details of color, feathers, etc.

## Activity II: Field Journal Practice Exercises

- 1) Choose a specific place where birds are present. The important thing is that some birds are present to enable students to observe and sketch changes they witness over a period of time. This will help students develop an awareness of birds' appearance and behavior, as well as colors and textures of changing habitat conditions, and to record these changes in their sketches. (The location will most likely be your schoolyard and need not include a wetland or waterfowl, although this would be ideal.) Now, select one or more of the field sketching practice exercises below.
- 2) Ask students to draw all plants, or all insects, they can see in one square foot plot.
- 3) Have students identify a 5' x 5' plot in your schoolyard or at their home. Have them identify and sketch all they observe in the plot including weeds, leaves, flowers, fungi, seed pods, insects, etc.
- 4) Have students record stages of growth by sketching the same plant at different stages of development.

## Activity III: Natural Area Field Trip

- 1) One of the objectives of the Junior Duck Stamp Program is to create naturalistic drawings and paintings of waterfowl. This requires opportunities to observe waterfowl and other migratory birds in their natural habitats. Look at a state or county map to determine the location of a nearby wildlife management area, National Wildlife Refuge, wildlife sanctuary, state or county park, and/or nature center. You can also contact MassWildlife, a local chapter of Ducks Unlimited or Massachusetts Audubon Society to inquire of good locations to observe waterfowl and other birds in your general area.
- 2) Remind students to bring their waterfowl project journals on the day of the field trip. Once at the site, have students develop sketches of plants and birds that they see using practice field sketching skills.
- 3) Have students disperse within a limited area for a limited period of time. If possible, have students develop sketches of waterfowl.

## Evaluation

Do students' sketches demonstrate a solid grasp of field sketching techniques? Do sketches reflect strong observational skills and ability to detect subtle differences and changes in nature?

*Art by G. Warner*

## Elements of Art

**Grades:** Middle, Secondary

**Objectives:** As a result of completing this activity, students will: Identify principles of art and design through the study of historical works of art including bird imagery (ART). Identify the impact of observation, study, and representation on science and natural history (SCIENCE).

**Materials:**

- prints or pictures from magazines or books of works of art, ideally recognizable famous prints, sculpture, painting, or other images of birds in art.
- prints or pictures from magazine or books of works of art representing many varied artistic styles, cultural traditions, and historic periods
- paper
- paints

### Activity I: Art Appreciation

- 1) Display one of the works of art (print, sculpture or other media) containing birds. This could be a reproduction of a two-dimensional or a three-dimensional work. Discuss what is referred to as Sensory Properties, including line, color, shape, form, and texture.
- 2) Explain the basic Aesthetic scanning Technique, in which students visually analyze a particular work of birds in art. Have students analyze and identify the Sensory Properties (line, color, shape, form, and texture) of a particular work.
- 3) Discuss the ways in which Sensory Properties (line, color, shape, form, and texture) are organized into Formal Properties. These are the principles of Composition and include repetition, variation, and balance.
- 4) Speculate about expressive qualities of art noting how art tries to express-literally, symbolically, and metaphorically-moods, ideas, and ideals. Try to assess what the particular works of art you have obtained are trying to express.
- 5) Have each student create a painting of waterfowl or other migratory bird and incorporate the sensory and formal properties into the painting. Ask the students before they get started to think about how they will utilize the sensory and formal properties and what messages, moods, or attitudes they hope to express in their paintings. (Students may wish to complete this exercise as a freestanding painting, or as a part of their journals)

### Activity II: Birds Across, History, and Artistic Styles

- 1) Obtain an array of art representing various cultures, historical periods, and artistic styles. Explain that birds have figured prominently in the art of many different cultures, including Mexican, Mayan, Native American, Asian, African, Egyptian, and others. For example, the ancient people of Mexico used beautiful feather ornaments on their headdresses and clothing. Using blowguns, they captured the beautiful quetzal bird, which had two long, golden green tail feathers. These were so valuable that the feathers were used as money. Death was the punishment for unauthorized killing of these birds. Ducks egrets, herons, toucans, parrots, quails, woodpeckers, jays, and pheasants also provided feathers for the pre-Colombians to use in making clothing, fans, shields, banners, and mosaics. Birds are included in art throughout the historical record, from cave paintings to modern times. Additionally, they are in many different artistic styles, including graphic, modern, naturalistic, and impressionistic.

- 2) Display individual works representing different historic and cultural styles. Discuss what each work expresses about the culture or historical period and how the birds in the work "symbolize" varied attitudes or emotions.
- 3) Have students choose one cultural, historic, or artistic style through which they will develop their own painting. Students will choose a bird they will paint. Make sure students observe other paintings from the culture, historical period or style before they get started. This exercise could be a freestanding painting or part of their Field Journal.

### Activity III: Museum Field Trip

- 1) Students may not be fully aware of the extent to which birds and wildlife are featured in many great works of art. Try to locate an exhibit or collection of birds in art by inquiring of local museums, art galleries, nature center, National Wildlife Refuge visitor centers, and zoos that currently feature birds in art. If possible, try to arrange a special docent tour.
- 2) While at the museum, have students identify as many works of art containing birds as possible. The collections may be paintings, sculpture, pottery, or a combination of media. The bird may, or may not be, the dominant feature in the work. Can students identify any of the specific species included in the art? You may wish to bring a field guide with you to the museum to help identify the bird species in the art.
- 3) Have students identify one painting or sculpture that they particularly like. Ask them to pay attention to how the artist rendered the bird and how they might like to draw the bird. Ask students to consider how the artist incorporated the different artistic properties in the painting.
- 4) Have students develop a sketch of the painting in their journals.

### Activity IV: Ask the Expert

- 1) Discuss the work of well-known bird and wildlife artists. If possible, provide pictures, or prints of several well-known works by these artists.
- 2) Invite a local artist to your classroom. Have the artist bring examples of his or her art to show the class. Ask the artist to discuss how he or she got started and what motivates and inspires him or her.
- 3) Introducing an established artist to your classroom would be a wonderful way to motivate your students. Inquire as to whether the artist may be willing to serve as an informal consultant for your students, particularly if they will be participating in the Junior Duck Stamp contest.

### Evaluation

Can students identify and describe the basic elements of art? Did student studies reflect an understanding of the principles of composition, including repetition (rhythm); variation (dominance); and balance (symmetrical and asymmetrical) to combine the elements of art into aesthetic wholes? Did students' paintings of birds developed in Activity II accurately depict an understanding of the culture, historic period, or style they were emulating?

# Waterfowl Painting Technique

**Grades:** Secondary

**Objectives:** As a result of conducting this activity, students will: Be able to use the principles of shape and form to portray waterfowl with the use of detailed pencil sketches to study a composition (ART). Gain greater understanding of waterfowl anatomy (SCIENCE).

**Materials:**

- mounted waterfowl specimens
- study skins
- pencils, sketching paper, erasers
- gouache and acrylic paints and appropriate brushes and palette trays
- illustration board or prepared board for acrylics
- water supply and large mouth 12-oz. plastic containers

## Instructions

1) Lead a general discussion on the importance of proper technique in painting waterfowl. Set up several study stations in the studio/classroom including (ideally) a mounted waterfowl specimen or study skins, with enough items so that each student can eventually study and work on one. Mounted specimens can be effectively displayed within habitat scenes.

2) Have students handle and study all the specimens carefully for several minutes. Then assign a particular body part to each student for detailed study. Have students first develop pencil line drawings to create accurate representations of body parts, paying close attention to shape. Then have students produce more sketches, using both line and shading to integrate the shapes and forms of waterfowl parts.

3) Discuss which techniques are most effective to render anatomical features such as feathers, feet, bills, and eyes? During the study, have students consider the adaptive characteristics of waterfowl anatomy, such as webbed feet, shape of bills, and type of feathers.

4) In a following session(s), have students paint anatomical items already studied in pencil. Students will now complete gouache and/or acrylic studies of these parts. First sketch the items lightly, but carefully on board, using pencil. Then, using a series of medium-to-small brushes, establish the shape and form of the object. Then using finer brushwork, experiment with color and brushwork to emphasize anatomical detail, and highlights for barbs, feathers, feet, wrinkles on skin, etc.

*Art by A. Olsen*

## Evaluation

Did students capture the shapes of waterfowl parts effectively? Did they begin to understand the three dimensional properties of these and to model their forms accurately? Did the students' gouache and acrylic studies demonstrate an understanding of color and brush techniques to portray details and highlights?

## Graphic and Visual Communication

**Grades:** Secondary

**Objectives:** As a result of conducting this activity, students will: Create and integrate graphic images and words, applying principles of two-dimensional design to communicate a message artfully (ART).  
Understand the waterfowl conservation message and be able to communicate it (SCIENCE).

**Materials:**

- paper and poster board
- pencil, pens, paints

### Instructions

1) Have students think about what they have learned concerning the need to conserve waterfowl and their habitat throughout the breeding grounds, wintering grounds, and stopover habitat along the way. Have students think about and write down a phrase, short list, or sentence, based on what they have learned, which summarizes a message they want to communicate about waterfowl. Students should consider the international dimensions of bird conservation in their message development. Discuss communication principles of developing "core messages" and determining methods to communicate these messages to "target audiences." In this activity, students' target audience may be their fellow classmates or students from a sister school in Latin America or the Caribbean.

*Art by N. Horne*

2) From a full or partial image depicting waterfowl already painted or drawn by the student, or one purposely produced, students should begin the design of an advertising layout. The layout will integrate the image and the words already written into a convincing and effective message about waterfowl conservation. Have students do quick preliminary layouts with pencils, crayons, or paint on newsprint first, until they get a combination of image(s) and words which they like, and which they think their classmates (their target audience) will understand.

3) Have students create their final advertising piece to communicate their conservation message.

4) Note: You may wish to allow photographic and collage pieces, but those may detract from the development of drawing, lettering and painting skills. Similarly, schools equipped with computers and appropriate software may wish to consider student graphic design of brochures about waterfowl-however, this should be carefully thought out. **While clipart and page design wizards in publishing programs can be used creatively, computer generated designs are not accepted as entries in Junior Duck Stamp state competitions.**

### Evaluation

Do advertising layouts create strong compositions? Is color and value used to good effect? Is the message clearly communicated? Is waterfowl imagery incorporated creatively? Do images and words work together effectively?

## Natural Sounds

**Grades:** Primary, Middle

**Objectives:** As a result of completing this activity, students will use music and language to communicate auditory observations (ART); and understand the importance of sound in observing the natural world, and birds in particular (SCIENCE).

**Materials:**

- audio tape with bird songs and calls
- tape player
- drawing materials - paper, colored pencils, crayons, etc.
- examples of poetry which feature birds.

### Activity I: Bird Songs

1) Hold a general discussion of the role of sound in our daily lives and in nature. Ask students which sense they rely on most heavily - smell, hearing, touch, or sight? Explain that bird watchers develop a strong sense of sight to identify birds by discrete markings such as color of wing bars and eye rings. Bird watchers also develop a strong sense of hearing to identify birds by their songs or calls. In fact, many expert bird watchers rely on their hearing to a greater degree than sight to identify birds.

2) Ask students to think about the bird songs and calls they have heard.

3) Darken the room. Tell students you will play a tape of bird songs. Encourage students to try to identify as many songs or calls as possible. After five minutes of listening, pause the tape and ask students the following questions:

- a) How many different birds did they hear?
- b) What other sounds did they hear in the background?
- c) Which bird songs had they heard before?
- d) Can they identify any of the birds on the tape?

### Activity II: Onomatopoeic Poetry

1) Onomatopoeia (on-ah-mat-ah-PEE-ah) means to use language to describe what we hear. Words like swish, thump, and gurgle are onomatopoeia. Ornithologists use this term to describe bird calls or songs. For example, the song of the American robin sounds like "cheerily, cheer up, cheerio, cheerily!" Even the names of some birds are onomatopoeia, such as veery, jay, killdeer and chickadee.

Ask students if they can think of any birds named by onomatopoeia. Note the examples included in the background section and ask students to list any others they can think of. Tell them that poets use onomatopoeia to enliven their poetry. An example by the famous naturalist John Burroughs follows in which he refers to the bluebirds " "turallee" flight note:

Bluebird  
A wistful note from out the sky,  
"Pure, pure, pure," in plaintive tone  
As if the wand'rer were alone,  
And hardly knew to sing or cry.

2) Play the tape again. Ask students to pay attention to any onomatopoeia they hear (for example swish, thump, and gurgle). Tell them to listen carefully because they will be writing short poems using onomatopoeia.

3) Assign students poems using onomatopoeia either as an in-class writing exercise or as a take home writing assignment. You could also have students write their onomatopoeia poems in small cooperative working groups. If you work with younger students, you could develop your onomatopoeia poems as a class.

### **Activity III: Sound Maps**

- 1) Distribute 8 ½" X 11" paper and have students draw a large circle on a blank sheet, placing an "x" in the center to indicate their location as shown on the diagram.
- 2) Relative to their position, have students mark the location inside the circle of each sound they hear. These marks should be simple representative sketches or symbols to indicate bird songs and other sounds. Have them try to note the direction the songs or sounds are coming from, their loudness, pitch, melody, and apparent distance away.
- 3) Allow approximately ten minutes for listening and recording. Back in the classroom, hold a discussion to identify the loudest, the softest, most pleasant, mysterious, or annoying bird songs.
- 4) Pass out colored pencils, crayons, and other drawing materials. Have students complete their sound maps by "coloring in" the spaces between the symbols with other elements of the habitat. Display sound maps in the classroom.

### **Activity IV: Bird Music**

- 1) Tell students you will play the tape one more time and have them listen very closely to one song.
- 2) Have students who play an instrument such as the flute, oboe, clarinet, trumpet, etc. try to emulate the bird's song on their instrument. Even if they do not own and play an instrument, students can produce the song's "beat" with their hands or simple percussion instruments. You may wish to work with a music teacher on this exercise. With some help, students might even try to develop simple musical notation of the bird's song.

### **Activity V: A Symphony of Animal Sounds**

- 1) Obtain a tape of "Peter and the Wolf" by the Russian composer Serge Prokofiev (1891-1953) which tells the story of the boy, Peter, and his three friends - the bird, the duck, and the cat.
- 2) Explain that "Peter and the Wolf" includes various musical instruments to represent animals: the bird is a flute; the duck is an oboe; the cat is a clarinet and; the wolf is three French horns. Ask students why they think Prokofiev selected the instruments he did for each character.
- 3) Play a portion of the recording and have students decide whether they want to perform the part of Peter, the wolf, the bird, the duck, or the cat.
- 4) Resume the recording and allow students to perform the role of Peter, the wolf, the bird, the duck, or the cat. Play recordings of other instruments and ask the students to describe what animals might be represented with each instrument.
- 5) Have students create a mural of a background scene for their favorite scene from the composition.

### **Evaluation**

Were students able to identify any of the birds they heard on the tape? Did students' poems demonstrate an understanding of onomatopoeia? Were students able to communicate what they heard graphically on their sound maps? Were they able to emulate aspects of bird song on instruments? Were they able to visually represent a scene that they listened to from "Peter and the Wolf?"

## Junior Duck Stamp Painting

**Grades:** Primary, Middle, and Secondary

**Objectives:** As a result of completing this activity, students will integrate all art and design principles previously introduced within a single painted or drawn composition, using a variety of technical art production skills (ART), and communicate knowledge of waterfowl anatomy and habitat (SCIENCE).

**Materials:**

- pencils
- paints
- watercolor paper or illustration board meeting competition requirements.

### Important note to teachers\*

The painting activity should be considered a culminating project for your Junior Duck Stamp curriculum and would likely be your final class/student assignment. If entering student designs in your state Junior Duck Stamp competition, please note that entry requirements may change from year to year. For information on obtaining current entry information, contact your state coordinator at MassWildlife at (508) 792.7270 or the National Duck Stamp Office at (202) 219.9820. This activity is presented early in the curriculum in order to prepare students for a final Junior Duck Stamp project. Whether or not entering your state's Junior Duck Stamp Contest is one of your students' goals, you may want your students to practice with these techniques throughout the course of the curriculum in order to link the class room learning activities to their final compositions.

1) Students will work with all the studies and reference materials already compiled in their journal projects.

2) Have students prepare a series of composition studies for their competition painting or drawing that considers the following issues. Are there one or several birds in the picture? Will they be in flight, on the water, or on the ground? Will the vantage point be from above, from below, or at eye level? What habitat will comprise the setting? Encourage students to study various combinations of these elements and finally select a strong composition, which also provides opportunities to focus on the anatomy of waterfowl, using artistic technique. Do not allow students, under any circumstances, to reproduce materials that are protected by copyright - this is against contest entry rules, and also discourages artistic creativity.

*Art by S. Onofrey*

3) Next, have students select a medium over which they have some mastery, and execute the painting or drawing of their chosen design. Begin this work with enough time for repetitions if something goes wrong or if the student wants to try several different compositions or techniques.

### Evaluation

Does the composition combine biological accuracy and creative power? Does the composition integrate the waterfowl within a landscape habitat? Do the painting and drawing techniques accurately represent the waterfowl anatomy? Does the work convey an understanding of waterfowl ecology as well as mastery of design principles and art techniques? Does the student understand the composition requirements, and does the entry meet the requirement?

*\*If entering the design in your state's Junior Duck Stamp competition be sure to use the current entry requirements.*

# Waterfowl Anatomy

**Grades:** Middle, Secondary

**Objectives:** As a result of completing this activity, students will create line drawings to represent the external anatomy of a bird (ART), and demonstrate an understanding of bird anatomy (SCIENCE).

**Materials:**

- reference such as an encyclopedia or biology book
- field guides
- pencils
- paper
- modeling clay
- papier mache

## Activity I: Bird Anatomy

- 1) Hold a general discussion on the essential aspects of bird physiology. What anatomical features allow birds to fly, many for long distances, during migration? What features allow ducks to float, swim, and stay warm in cold water? Do students know which species represents the largest bird and which represents the smallest bird?
- 2) Review the terms used to identify various parts of a bird's external anatomy. Pay particular attention to the specific features that enable waterfowl to fly and swim including hollow bones, strong pectoral muscles, and webbed feet. Review anatomical terms with students.
- 3) You may wish to provide a blank copy of a waterfowl anatomy diagram and have students identify anatomical features on the blank diagram to enforce learning.
- 4) Cluster the class into groups of four students each, and distribute reference materials and field guides. Ask members of each group to select either a duck, swan, or goose.
- 5) Tell students they will each be making an anatomical sketch of their bird. Ask students to identify the species they selected in a field guide.
- 6) Students will begin by making a simple line drawing of their selected species and identifying its anatomical features.
- 7) Students should make their illustrations detailed enough to highlight as many anatomical features as possible. Have several students present their illustrations to the class. Display illustrations around the room.
- 8) (Optional) Obtain a slide show, or compile individual species slides of various migratory birds. Show a series of slides of waterfowl, shorebirds, raptors, and songbirds, pausing long enough at each slide for students to develop a quick line sketch noting the species' particular anatomical features. After you have finished showing the slides, have students identify the specific anatomical features they have sketched.

## Activity II: Anatomy Sculptures

- 1) Have students make papier-mache or clay sculptures of the birds they sketched. Once the basic structure is in place, have students paint their sculptures to highlight as many anatomical features as possible.

## Evaluation

Do student drawings reflect an understanding of the external anatomy of their selected species? Do students' sculptures represent an ability to manipulate the materials (clay, papier-mache, other materials) in order to develop a three dimensional form of their bird's anatomy?

# MEETING THE MIGRANTS

Scientists estimate that about 9,000 species of birds exist world wide. Approximately 660 species of birds breed in North America. Some birds are known as resident birds which means they stay in one place all year long. Others migrate as the seasons change. Some travel short distances and remain within the United States. Others migrate longer distances and travel into South America. There are approximately 60 species of ducks, swans, and geese classified under the Migratory Bird Treaty Act by the U. S. Fish and Wildlife Service.

Approximately 340 species of birds migrate to the tropical regions of Mexico, Central America, South America and the Caribbean. These species are known as "neotropical" migratory birds and include raptors, waterfowl, shorebirds, and songbirds. "Neo" refers to "new world," or the Americas, and tropical refers to the latitudinal region between the Tropic of Cancer and the Tropic of Capricorn. Of the 60 species of ducks, swans and geese, approximately one third to one half can be said to be neotropical migrants.

All birds have certain features in common. These include feathers, wings, although a few, such as ostriches, cannot fly. Except for some flightless and diving birds, they all have hollow bones. All birds have beaks. And all birds lay eggs. Ducks, swans, geese, and most seabirds spend months on the water and many birds dive underwater in search of food, but they never get wet through to the skin. They coat their feathers with oil from a special gland and constantly preen to keep feathers overlapping like tiles on a roof.

It is important to note that populations of many birds are in danger. In the past ten years, the number of threatened birds in the world has risen sharply. The root cause of population decline is loss of habitat throughout their migratory range. As our human population increases, more and more land is cleared for agriculture, livestock, timber, and development while resources are degraded and consumed faster than nature can replenish them. Many birds, once well adapted to their habitat, cannot survive sudden changes in their environment, they must have adequate time to develop new survival mechanisms and/or skills. Among the birds most affected by changes are:

- top carnivores with relatively small populations that are susceptible to over-harvesting and/or changes in the availability of prey. An example is the bald eagle whose population has been dramatically affected by DDT contamination in prey species such as rodents;
- island species, as well as other geographically isolated species that are frequently adapted to predator-free or competition-free habitats. An example is the Hawaiian Nene Goose, which is federally listed on the islands of Hawaii. Another example is the Golden Cheeked Warbler. Rapid rates of development in and around this neotropical migrants limited breeding habitat in south Texas has resulted in its listing as an endangered species;
- birds with specialized diets.

The U.S. Fish and Wildlife Service is charged with managing populations of endangered species. The agency carries out this responsibility by maintaining over 500 National Wildlife Refuges that provide safe haven for many endangered species whose habitats have been destroyed or drastically reduced. There are some 50 - 55 species of birds classified under the Migratory Bird Treaty Act listed as endangered. Each of these represents hope for the future - hope that wise conservation practices will produce balance within the natural world once again.

## Adaptation Artistry

**Grades:** Primary

**Objective:** As a result of completing this activity, students will experiment with a three-dimensional medium to represent a natural object and compare the use of line, form, and shape to represent the same object in two-dimensional media (ART), and understand the adaptive advantage of specific morphological characteristics of birds (SCIENCE).

**Materials:**

- clay or modeling dough
- pipe cleaners
- premixed papier mache material
- tape, markers, crayons, or colored pencils
- white cardboard or stiff white paper
- paints
- scissors

### Activity I: Feet are Fantastic

1) Ask students to think of some of the ways birds use their feet. Then discuss different shapes and characteristics of birds' feet and their uses. (In other words, do water birds' feet serve the same purpose as song birds'? Do they look the same?)

2) Distribute to your students, pictures of different birds - including their feet - you have collected from birding books, calendars, & magazines.

3) Cluster students in working groups and distribute lumps of clay or modeling dough. Tell students they will be making models of a bird's feet from the modeling clay. They may choose to model the feet of a waterfowl or a songbird or any bird whose picture you have distributed to them.

4) When students have completed their clay "feet," have each student draw a picture of his or her bird on a piece of white cardboard or stiff white paper, color it, and cut out the shape. Then have students construct legs by twisting two pipe cleaners together. The pipe cleaners, with the bodies attached, are then pushed down into the clay feet before the clay dries.

5) Have students present their models to the class and then display the models around the room.

*Art by J. Cheng*

### Activity II: Feet are Fantastic Dances

1) (Optional) Have individual groups of students develop Feet Are Fantastic dances (independently or in a group). Discuss Native American dances that represent birds. Have student think about how their birds move, based on the feet and anatomy. Ducks waddle, songbirds hop, cranes strut, etc. Have students present their Feet Are Fantastic dances to the class.

Art by C. McCormack

### Activity III: Bills and Beaks are Beautiful

1) Hold a general discussion of the different types of bills and beaks and how each is necessary for different food preferences and feeding behaviors among birds. Discuss some of the more unique beak and bill shapes, such as those of Roseate spoonbills, Shovelers, Flamingoes, Pelicans, Woodpeckers, and Hummingbirds. Explore with students the reasons for the particular bill or beak shape.

2) Cluster students into working groups and distribute field guides or pictures of different kinds of birds. Tell students they will be working as a group to make papier mache masks depicting one bird.

3) Have groups select the bird for which they will make their mask. Have them outline their selected bird's head on a piece of paper and consider what molding shapes they will need to create their papier mache mask. Will they need a balloon, baseball cap, or other object to provide a mold for the shape of the head or beak?

4) Once each group has developed a reasonable plan for its mask, distribute papier mache materials. Allow groups to construct their papier mache bird head and bill or beak. Several class periods may be required for completing the basic papier mache mold. The papier mache molds will need to dry for a day or two.

5) Once the basic molds are dry, students can finish the papier-mache to depict the birds facial features and bill or beak using paints or markers. Have them carefully consider pictures of their selected bird in the field guides.

6) After the papier-mache masks are completed, have the groups present their masks, perhaps with one student wearing the mask and several others describing the bird and why they developed their mask as they did.

### Activity IV: Bills and Beaks Are Beautiful Skits

1) Have students consider what types of food their bird eats based on its beak or bill shape. Does it "dabble" for underwater plants and other aquatic organisms. Does it feed on berries and seeds, insects while flying, worms from the ground, grubs from under tree bark? Have students develop a dance to represent their bird's feeding behavior based on the shape of its beak.

2) Have students with different bird and beak masks get together and develop a short skit based on the differences of their food preferences and feeding behaviors.

### Activity V: Nests are Neat

1) Hold a general discussion about different birds' types of nests. Discuss the difference between ground nesters, tree nesters, and cavity nesters. Discuss the main purposes of nests and ask students why they think certain types of birds have developed different types of nests.

2) Have each student select the type of nest he or she would like to build. Have each student consider the materials necessary to build the nest - clay, straw, etc. Have each student make a materials list.

3) Cluster students into working groups and distribute nest building materials -clay, straw, newspaper, yarn, etc. Have students build their nests and present them to the class. (Students may wish to place their "nests" outside to see what they attract!)

4) (Optional) Another way to conduct this activity would be as a basket-making activity. In this approach, students can design and weave baskets that represent birds' nests and discuss the similarities and differences between the baskets and nests.

## Evaluation

Do student's feet models demonstrate a strong facility in the use of the materials of construction? Do students' understand how the food shapes relate to the different ways birds use their feet? Do students' papier-mache masks, dances, and skits demonstrate an understanding of how birds' unique food preferences require different bills or beak shapes and structures? Do students' nests demonstrate an understanding of the purposes of nests and the materials birds use to build nests?

## Endangered Birds

**Grades:** Middle

**Objectives:** As a result of completing this activity, students will create placard costumes and conduct dramatic role-playing to determine the reasons for the endangerment of selected migratory birds (ART), and develop an understanding of the ecological reasons for certain species' endangerment and possible extinction (SCIENCE).

**Materials:**

- field guides
- pieces of large poster board or poster paper
- magic markers
- cord or yarn
- hole reinforcers (found in office supply stores)
- pictures of extinct birds such as the **Great Auk**, **Passenger Pigeon**, **Carolina Parakeet**, **Heath Hen**, and **Labrador Duck** (optional)
- list of threatened and endangered birds.

### Activity I: Dateline Endangered

1) Discuss concepts of extinction and endangerment referring to bird species that have become extinct such as the **Great Auk**, **Passenger Pigeon**, **Carolina Parakeet**, **Heath Hen**, and **Labrador Duck**. (Refer also to the discussion on endangerment in Meeting the Migrants.)

2) Distribute the list of Endangered Migratory Birds. Tell students they will be creating life-size poster placards of an endangered bird of their choice. Have students identify several of the birds listed as endangered in field guides.

*Great Auk, John James Audubon*

Have each student choose an endangered bird and research its basic habitat requirements. Students can get most of the necessary habitat information from field guides.

3) Distribute poster paper, markers, crayons, and other drawing materials and have the students create an enlarged image of their bird to fit the size of the paper. Once students have completed their endangered bird posters, punch holes in the top of the posters and thread the top with a piece of cord or yarn. Reinforce the holes with circular, adhesive reinforcers to avoid tearing.

4) Divide the class into two groups. Tell members of group one that they will be interviewing members of group two. Members of group two will "wear" their endangered bird posters. The job of group one is to determine why the members of group two have become endangered. Have the students in group one develop a series of interview questions following a line of inquiry, to develop critical-thinking skills. Questions may include, but are not limited to, the following:

- a) What bird species are you?
- b) What is your habitat like?
- c) What are your favorite foods?
- d) Where do you spend the winter?
- e) Where do you spend the summer?
- f) What is happening to your habitat in your breeding grounds?
- g) What is happening to your habitat in your wintering grounds?

5) Once members of group one have developed their questions, have them pair up with one of the members of group two and conduct their investigative interviews. Once the interviews are complete, have each member of group one present the results of his or her interview. Presentations by members of group one should adequately address the causes of why the species represented by his partner (from group two) has become threatened or endangered.

6) Now switch and have members of group two interview members of group one.

## Activity II: Endangered Species Skits

1) Cluster the students into groups of four or five. Tell the students they will be creating skits based on the information they obtained about why the birds represented on their placards became endangered, what conservation efforts could be conducted to help them, and what may happen if nothing is done. Have them bring their placards with them to the working groups.

*Young Whooping Crane, John James Audubon*

2) Have the students in each group present their skits to the rest of the class. The endangered species skits could provide a wonderful presentation for a school-wide International Migratory Bird Day festival.

## Evaluation

Do students' placard/posters effectively illustrate the endangered species they chose? Do the presentations of the results of students' interviews and the group skits reflect an understanding of the concepts of endangerment and extinction and the main reasons why these occur?

# MYSTERIES OF MIGRATION

In most areas of the country, changing seasons mean birds on the wing. Every fall, millions of birds that have nested in the United States and Canada fly south to wintering grounds in the southern United States, Mexico, Central and South America, and the Caribbean. Each spring, when the weather warms in the Northern Hemisphere, migrating birds leave their wintering grounds and return to the United States and Canada to breed. Watching bird migration in progress is an inspiring and simple way for children to learn about the remarkable rhythms of the natural world. Although much about bird migration remains one of nature's great mysteries, scientists have learned much about the "whys" and "hows" of bird migration. For example, we know that most migrating birds rely on a variety of the following senses and cues.

Photoperiodism, the lengthening and shortening of days in spring and autumn, affects birds' pituitary and pineal glands. These glands generate hormones that stimulate birds to become increasingly restless. Daytime migratory birds use vision to steer by the sun, aided by a precise sense of time. Night fliers take compass cues from star patterns. While in flight, birds may use geographic landforms to help them orient direction and course. The outline of North American coasts, and the north-south direction of many large rivers and mountain chains, aids in migration. Homing pigeons and some migratory birds see ultraviolet and polarized light to assist their migration.

Many scientists believe that migratory birds tune in to the earth's magnetic field in combination with gravity for direction. Birds usually wait to migrate until the passage of weather fronts. They make use of the favorable winds that follow storms to aid their flights. Most long-distance migrants have a highly developed respiratory system, hollow bones, internal air sacs, and specialized body shapes. Birds' pectoral chest muscles, which power their wings, are much larger and better developed in relation to overall size than are any similar muscles in mammals. Before migration, most species build up layers of fat. All of these features enable migrating birds to fly high, fast, and for long periods of time.

The destination to which birds migrate is generally determined by the presence of food, water, and shelter. The term migratory route indicates the general direction of flight that is annually followed by migrating birds on their journeys between wintering and breeding grounds. Migratory routes do not refer to exact, specific routes. Rather, birds tend to follow general north-south pathways between major habitats and avoid crossing obstacles such as mountain ranges.

Migratory birds and waterfowl cross international boundaries on their biannual migration to and from breeding grounds in Canada and the United States and wintering grounds in Mexico, Central and South America, and the Caribbean. As such, international approaches to conservation must be implemented to maintain populations of migratory birds. The U.S. Fish and Wildlife Service Office of International Affairs works in these countries to protect critical habitat, particularly wetlands, and to train wildlife managers in state-of-the-art wildlife and habitat conservation techniques. The U.S. Fish and Wildlife Service is also the lead agency in negotiating and enforcing international agreements and laws regulating the import and export of migratory birds and other wildlife.

In addition, the U. S. Fish and Wildlife Service carries out a variety of research and monitoring projects that help track bird migration, including bird banding, radio telemetry, and satellite imaging projects. These projects provide valuable information for conservation and management of migratory waterfowl, shorebirds, songbirds, and raptors. Activities in this section will:

- introduce students to the concept of migration;
- expose students to the four major flyways;
- increase students understanding of the resources that aid, and the hazards that pose threats to, bird migration.

## Migratory Bird Collages

**Grades:** Primary

**Objectives:** As a result of completing this activity, students will be able to use color, shape, line, and texture to create a collage that communicates the concept of migration (ART), and demonstrate an understanding of the benefits that aid, plus the obstacles that hinder bird migration (SCIENCE).

**Materials:**

- paper or poster board
- old magazines
- map of North and Central America
- pencil, pens, markers, crayons, glue.

- 1) Tell students they will be making two collages. The first will represent all the items students would need to take a long trip. The second will represent all the items birds need to migrate.
- 2) Discuss with students all that they know about bird migration. How do they think a bird travels such a long distance without stopping? Discuss cues for migration, as outlined in the section overview, "Mysteries of Migration." Now create a list of all the items students think they would need to go on a road trip traveling a similar distance as the birds - such as a car, gasoline, rest stops, suitcases, etc.
- 3) Have students select a specific species for their collage.
- 4) As homework, have students research their selected bird's migratory route and ask students to bring in old magazines from home.
- 5) Cluster students into groups so that they can share magazines. Distribute two copies of the Western Hemisphere map for each student. Have students trace the migratory route of their selected bird on one map. Have them trace the route of an imaginary vacation car trip on a second copy. Students will make collages of all the items their selected species needs to "migrate" on the first map. They will make a representation of all the things they need to migrate on the second map. Students may wish to add free hand drawings to fill out their collages.
- 6) Have several students present their migratory collages to the class and display collages around the room.

### Evaluation

Do the collages communicate an understanding of birds' requirements for migration? Can students articulate similarities and differences between a bird's migration and a long car trip?

## Fashion A Feather

**Grades:** Primary

**Objective:** As a result of completing this activity, students will: Be able to observe various repeated shapes in feathers and explain that feather shapes are often made of combinations of smaller shapes (ART). Understand the significance of different types of feathers in bird anatomy (SCIENCE).

**Materials:** **Part 1**

- examples of flight and down feathers
- illustration of flight and down feathers
- construction paper or poster board
- magnifying glasses (optional)
- glue, straw or sticks
- flat toothpicks
- pipe cleaners

**Part II**

- feathers (available at craft shops)
- art paper
- newspaper (for covering)
- pastels or crayons
- black, water-based ink
- stiff paint brush (1/2-1")
- construction paper

### Activity 1: Flight and Down Feathers

1) Explain that birds have two types of feathers: contour feathers, which are found on the bird's body, wings and tail; down feathers which are fluffier and softer and lie under the contour feathers. If possible, give each student a contour feather and a down feather. Have students observe feathers closely. Explain that the hard center tube is called the shaft and the rest of the feather is called the vane. Have the students draw pictures of their feathers and label the vane and the shaft in their journals.

2) Now explain that the vane is made up of hundreds of barbs that look like skinny hairs coming off the shaft in parallel rows. To show students the barbs, place a large contour feather on an overhead projector. The enlarged silhouette will show how the barbs stick out from the shaft. It will also show the tiny barbules that grow from each of the barbs. Have students draw a second picture of the enlarged view of the feather, including barbs and barbules, as seen on the overhead projector.

3) Have students develop quick comparative sketches of contour and down feathers in their journals. Have them pay attention to the stroke of the pen or pencil they use for the flight feather versus the stroke they use for the down feather. Provide the students magnifying glasses so that they can take a close look at the feathers.

4) Divide the students into two groups. Group one will construct flight feathers by following procedure A. Students constructing down feathers will follow procedure B.

#### A) Flight Feathers

- 1) Glue a straw to a piece of construction paper.
- 2) Cut pipe cleaners in various lengths.
- 3) Arrange the pipe cleaners so that they extend from the straw as barbs of the feather, starting with the longest and progressing to the shortest.
- 4) Glue pipe cleaners in place to create a model of a flight feather.

## **B) Down Feathers**

- 1) Glue a flat toothpick to an index card.
- 2) Cut 4-8" lengths of yarn.
- 3) While pinching one end of each piece of yarn, unravel and fray the other end.
- 4) Glue the pinched end to the toothpick leaving the wider end of the toothpick bare. Have some of the yarn pieces come straight up from the toothpick if possible to add depth and to create a more realistic down feather.
- 5) Have students in group one and two present their feather models. Compare and contrast differences and similarities between flight and down feathers.

## **Activity II: Feather Prints**

1) First technique suitable for lower primary grade levels. Place a feather on a piece of paper and cover it with another sheet of paper. Gently rub the cover sheet with pastel or crayon. Use color combinations to create a more realistic rubbing. Once students have completed their rubbing, tell them that their feather now represents a wing. Have them draw the rest of the bird around the new wing.

2) Second technique suitable for upper primary grade levels. Place a feather that has a sturdy shaft on a newspaper-covered table. Brush a thin coat of ink on the feather using a paintbrush. Place the ink side of the feather down on a sheet of art paper, cover it with a second piece of art paper, and press gently over the entire surface of the feather. Remove the covering paper. Grasp the shaft of the feather and remove it gently from the art paper. Hang the art paper for drying. Discuss as a class the similarities and differences of the feathers based on the rubbings. Include topics in the discussion such as the shapes, parts, types, and functions of a feather.

*Art by S. Hunt*

## **Evaluation**

Do students' feather models reflect repeated patterns, and design elements of natural feathers? Can students analyze differences between flight and down feather designs?

## Migratory Adventure Storytelling

**Grades:** Middle, Secondary

**Objectives:** As a result of completing this activity, students will: Develop creative writing and illustrating skills to develop a short story (ART). Develop a thorough knowledge base of the life history of one species (SCIENCE).

**Materials:**

- field guides
- ecology reference materials (see Resources)
- painting and drawing materials
- video equipment (optional)

### Note to teachers:

In this activity students will create an illustrated short story on the life history of one bird species. As an adjunct to this activity, you may wish to include the traditional art form of storytelling in which students recount a portion of their stories for the class. If you choose to incorporate storytelling as part of the activity, let students know early so they can practice their presentations.

1) Tell students they will have an opportunity to track the life history of one bird species through the creation of a short story on its migration. Let them know that many authors and storytellers go to great lengths to research details about a particular subject on which they will write. This is an opportunity for students to research one species in depth and then create an illustrated short story to represent its life cycle.

2) Tell students that while the Migration Adventure Story is a creative writing assignment, all stories must incorporate the following factual information on the species:

- a) its breeding grounds
- b) preferred habitat in breeding grounds
- c) food preferences in breeding grounds
- d) mating behavior-mating for life or switching mates etc.
- e) migratory route
- f) facts and features about migration-  
distance, flying time, senses, and cues, etc.
- g) hazards faced during migration
- h) important stopover areas
- i) wintering grounds
- j) preferred habitat
- k) cultural aspects of wintering grounds
- l) conservation issues affecting the species
- m) efforts being made to conserve the species

Art by J. Mastrorio

*\*Stories should also include five to ten well-developed illustrations.*

3) Give students an appropriate period to research and write the short stories. Remind students that their stories will include illustrations. They should be identifying what illustration they will develop and in what medium they will create them. You may want to include class time for students to work on their illustrations.

4) Once students have completed the manuscript and illustrations for their short stories, have them determine in what way they will produce their book. They may choose a simple black and white copied and stapled book binding format or consider a color copied and laminated cover, or other format to present their Migratory Adventure Story. (This is a possible opportunity for students to experiment with different computer desktop design features, if available).

5) (Optional) Have students present a portion of their Migration Adventure Stories to the class through storytelling. You may wish to impart the rich tradition and serious art form of storytelling to students by inviting a local storyteller to present a story to your class. You may also wish to videotape student presentations in order to have film documentation for later evaluation of storytelling techniques, or to send to a sister school in Mexico or Latin America.

6) (Optional) Have students present their Migration Adventure Stories in the form of a treatment and/or script for a slide show, video documentary, or a film. This will require that students closely consider the visual attributes of their stories and suggest visual sequences to support the story line. Ambitious students might even attempt to produce a Migration Adventure Story slide show.

### **Evaluation**

Do student Migration Adventure Stories incorporate factual information about a particular species in an interesting, inspiring, and creative format? Do illustrations reflect a strong understanding of the subject matter? Do oral presentations demonstrate good use of body and voice in delivering the Migratory Adventure Stories?

## **I'll Fly Away**

**Grades:** Primary, Middle

**Objectives:** As a result of completing this activity, students will develop ability in the use of symbols and drawings to tell a factual story (ART), and increase their understanding of the North American flyway (SCIENCE).

**Materials:**

- butcher paper
- magic markers
- crayons
- poster board
- poster paints
- crepe paper streamers (four colors)
- field guides
- map of North American flyways ([www.birdnature.com/flymap](http://www.birdnature.com/flymap))
- map of the National Wildlife Refuge System ([www.fws.gov](http://www.fws.gov))

### **Activity I: I'll Fly Away Murals (Primary)**

1) Prepare for this activity by covering one wall or area of the classroom with white mural paper and drawing a large representative map of North America on the paper.

2) Divide the class into four (or eight) groups of no more than four or five students each. Assign one of the flyways to each of the four (or eight) groups - Atlantic, Mississippi, Central, and Pacific. Explain that flyways generally follow major coastlines, river systems, and mountain chains. Have the groups refer to the flyway maps to identify where each of the flyways originates and ends.

3) Distribute crepe paper and have groups attach crepe paper streamers to the wall mural map to represent the flyways from beginning to end. For example, the Pacific flyway originates in Alaska and extends roughly southward along the Pacific coast into northwestern Mexico.

4) Now have students embellish their flyway murals by using paints to add other geographic, physical, and living features they might find along their flyways. Examples include mountain chains, rivers, major cities, lakes state boundaries, etc.

*Art by J. Moll*

## **Activity II: North American Flyways and the National Wildlife Refuge System (Middle)**

1) Distribute maps of the National Wildlife Refuge System. Explain to students that the National Wildlife Refuge System now includes more than 500 refuges. Most refuges are aligned more or less along major flyways. This is because many refuges were originally created to provide safe habitat for migrating waterfowl. Waterfowl require habitat throughout their flyways and National Wildlife Refuges represent "links in a habitat-chain".

2) Have students identify five to ten refuges located on their designated flyway. Have them identify the approximate locations of these refuges on the wall flyway murals. Now have them either write the names of the refuges, or paint representative images of the refuges at the approximate locations on the flyway mural maps.

3) Distribute field guides. Have students select one waterfowl that migrates on their flyway. Distribute 8 ½ " by 11" sheets of paper. Have them paint images of their birds and cut silhouettes of the birds from the paper. Now have students adhere their waterfowl on their flyways.

## **Evaluation**

Do students' flyway mural maps in Activity I exhibit an understanding of the North American flyways? Do students' flyway murals in Activity II represent an understanding of the relationship between the location of National Wildlife Refuges and the North American flyways?

# HABITAT IS WHERE IT'S AT

Every species of bird, fish, insect, reptile, amphibian, and mammal has basic needs for food, water, shelter and space. These components make up an animal's habitat. Waterfowl are dependent on wetlands, which are among the most productive ecosystems on earth and home to more endangered species than any other type of habitat. Wetlands also support shorebirds, wading and marsh birds, and songbirds. It is not surprising that wetlands-dependent birds have experienced significant declines. The United States has lost more than one-half of the wetlands that existed prior to European settlement. Today, fewer than 93 million acres remain, and wetlands continue to decline by about 200,000 acres each year.

Migratory songbirds, including warblers, vireos, finches, flycatchers, thrushes, swifts, tanagers, and orioles, require intact forests and grasslands throughout their migratory range. Vast woodlands once covered much of eastern North America from the boreal forest of Canada to the pine forests of the southeastern United States. In the more arid west, the Rocky Mountains are forested too. Since the time of European settlement, approximately 90 percent of the original forest cover in the contiguous United States has been logged or lost to urban and agricultural development.

Migratory birds require adequate habitat in their wintering grounds in Mexico, Central and South America, and the Caribbean. Tropical forests and wetlands of the Western Hemisphere are home to several thousand bird species both resident (remaining in the tropics all year) and migratory. Tropical forests worldwide continue to be eliminated at the rate of nearly 50 acres per minute.

As a group, grassland-dependent migratory bird species have shown steeper, more consistent, and more geographically widespread declines than have any other group of birds. Songbirds, shorebirds (e.g. the long-billed curlew and the upland sandpiper), and many raptors are among the migratory birds dependent on grassland habitats. Since 1830, tall grass prairie has been reduced by more than 95 percent because of destruction of native prairie for agriculture, grazing, and development.

The National Wildlife Refuge System encompasses a broad array of the habitats required by migratory birds. Managed by the U.S. Fish and Wildlife Service, the National Wildlife Refuge System includes over 500 refuges, which range in size from just a few acres to millions of acres. Many refuges are dominated by wetlands, but all other habitats are represented, including coastlines, forest, grassland, deserts, and even arctic tundra. Each refuge is entirely unique, yet all have one characteristic in common - a goal to conserve wildlife and their habitats for people.

The National Wildlife Refuge System provides a means to protect a remnant of what America was once like, where you, your students and their families can witness squadrons of Canada geese, snow geese, black ducks, canvasback ducks, mallards and many other species of waterfowl in precision flight on their way from Canada and the northern United States to warmer climates. Through the Junior Duck Stamp Program and other contributions, you and your students can be a part of the continued growth and development of the National Wildlife Refuge System.

As a result of completing the activities in this section, students will:

- become aware of the basic components of habitat required by all animals - food, shelter, water; space;
- understand the different habitat types required by migratory birds;
- understand the balance of ecosystems and that all components of the ecosystem are required to maintain habitat health;
- become aware of the important role played by National Wildlife Refuges in maintaining populations of migratory birds.

## Wonderful Habitats for Wacky Birds

**Grades:** Primary, Middle

**Objectives:** As a result of completing this activity, students will use art production skills and employ principles of three-dimensional shape, color, and texture to create imaginary habitats and birds (ART), and gain an increased understanding of the relationship of species' adaptations to habitat conditions (SCIENCE).

**Materials:**

- paper
- drawing materials - colored pencils, markers, paints
- arts and crafts materials - pipe cleaners, modeling clay, toilet paper tube, construction paper, etc.
- field guides (optional)

### Activity I: Wacky Birds

1) Define and discuss adaptation as it relates to the evolution of a bird's anatomy and behavior. Have students brainstorm about some "adaptations" they may have developed to "survive" in their own habitats (homes). Have students consider both the "physical" and "behavioral" adaptations that birds have developed to survive in their habitats. These may include hollow bones for light weight in flying; fast growing fledglings that can fend for themselves early on and will be big and strong enough to migrate in the fall; camouflage coloring of young to hide from predators; air sacs in their bones to help them float (they pump air out when they dive). Have students list all the adaptations they can think of that waterfowl species have evolved to survive in its habitat. You may wish to have them record this list in their Waterfowl Journals.

2) Tell students they will each have a chance to design and create a "Wacky Bird" - one well adapted to its habitat. Have students consider the various adaptations they will want to include in their wacky-bird creations by completing the chart below before they get started.

### Wacky Bird Planning Chart

- size
- dominant colors
- favorite foods
- habitat preferences
- nesting materials
- features that protect from predators e.g. camouflage

3) Cluster students into small groups and distribute craft materials, including toilet paper tubes, pipe cleaners, modeling clay, paper, colored pencils, crayons, etc. Have students develop craft sculptures of their Wacky Bird using their adaptation charts as a reference.

4) (Optional) You may wish to have students write short narrative descriptions of their Wacky Birds to more fully describe their Wacky Birds adaptations, habitat, and food preferences, etc.

5) Have students present their birds to the class, paying particular attention to what they wrote in the habitat preferences section of their Wacky Bird planning chart. Once all the students have presented their Wacky Birds, hold a general discussion about the ways in which real birds have developed specific physical and behavioral adaptations to survive in their environment and particular habitat.

### Activity II: Wonderful Habitats

1) Students should now fully understand, and be able to articulate, how their Wacky Bird is adapted to a particular type of habitat and how this habitat supports the Wacky Bird. Tell students they will be creating a wonderful habitat for their Wacky Bird. You may wish to have students develop their wonderful habitats as a large mural-type illustration, a diorama, or in another format. Tell students that their wonderful habitats must be developed to support their Wacky Bird's adaptive characteristics. Have students consider the habitat components required by all birds before getting started. What specific characteristics will students incorporate for each of these habitat components to support their Wacky Bird? What food, shelter, water, space?

2) Have students create wonderful habitats incorporating these habitat requirements.

3) (Optional) Have students take their Wacky Birds to "visit" the wonderful habitats developed by their classmates. Have students consider whether or not their Wacky Bird could survive in any of the other habitats based on its particular habitat needs. Have the entire class evaluate all of the wonderful habitats and determine if any one wonderful habitat could support a variety of the Wacky Birds.

### Evaluation

Do students' Wacky Birds demonstrate principles of composition: balance, repetition and variation? Do students' Wacky Birds' wonderful habitats demonstrate general facility with the use of the elements of art: line; color; flat shape three-dimensional form; and texture? Do students' Wacky Birds demonstrate a basic understanding of adaptations?

*Art by B. Vail*

## Camouflage Collages

**Grades:** Primary

**Objectives:** As a result of completing this activity, students will: Use elements of color, pattern, form, texture, layout, and design to illustrate camouflage (ART). Demonstrate an understanding of camouflage as an important adaptive characteristic for birds (SCIENCE).

**Materials:**

- newspaper to cover work areas
- liquid starch or diluted white glue
- containers to hold the starch or glue, one per group of students
- stiff bristle brushes, one per student
- old magazines and newspaper
- scraps of tissue paper in assorted colors
- scissors
- duck outlines
- magazines or library books showing pictures of butterflies and other insects
- construction paper
- "List of North American Ducks, Swans, and Geese"

### Instructions

- 1) Have students identify a waterfowl species from the "List of North American Ducks, Swans, and Geese". Have them make two simple line-drawing outlines of the selected waterfowl. Have them write the name of the species they chose on the back of their line drawings.
- 2) With the help of the field guides, have students add color to just one of their line drawings with paint or markers. Tell students they should represent their bird's markings and coloration as accurately as they can on the outline.
- 3) Ask students to describe their bird's habitat to the best of their ability. Is it a marshy wetland? A coastal area? They may need to refer to their field guides to determine their bird's habitat. You may wish to have students describe the habitat verbally, in writing, or by sketching it.
- 4) Tell students they will be creating a wetland habitat that will camouflage their bird. Cluster students into working groups to create wetlands backgrounds. Explain the following procedure before getting started:
  - a) Groups will each receive sets of construction paper in shades of green, brown, blue, and gray. Ask them to cut the construction paper into various shapes including strips, squares, and circles.
  - b) Have students pour liquid starch or dilute glue onto a sheet of construction paper with a brush, pick up a scrap of paper with the sticky brush, and put it down on a patch of glue.
  - c) With more starch or glue, brush it flat against the paper. Paint another spot and place a second different colored scrap paper so that it overlaps the first scrap. Use glue or starch to brush it flat.
  - d) Continue the process until the entire sheet of construction paper is covered with scraps of various colors of greens, browns, grays, and blues, to represent an impressionistic wetland.
- 5) Once you are sure students understand the procedure, have them get started. When the wetland background is completed, have students hold up their paper ducks and discuss how the ducks could blend in with the background. Ask students whether it would be more difficult to camouflage a male or a female duck, and why.

- 6) Now have students adhere their duck drawings to the wetland background. Are the drawings camouflaged or do they stand out? How could the ducks be more camouflaged? Have students use liquid starch or glue to paste scraps of colored paper over the bird, as if it were swimming in or through the rushes.
- 7) Now have students adhere their blank white duck sketch to the wetland background. Ask them to think about why the blank white duck stands out so visibly and consider the functions that certain coloration patterns of ducks serve in terms of camouflage. Discuss how students portray these characteristics in their art.
- 8) Display the dried camouflage collages. Have students notice how both color and pattern help camouflage the birds. Help them notice and discuss the contrast between the plain and camouflaged ducks.
- 9) (Optional) You may wish to play the following camouflage game with students. Have them adhere the camouflage ducks they created for this activity to poster board. Let one half of the group hide their ducks outside where they will be concealed by vegetation to create the affect of camouflage. The other half of the group can try to locate the camouflaged ducks.

### Evaluation

Do student collages demonstrate an understanding of how color, pattern, texture, layout, and design can be used to develop an image of camouflage?

*Art by C. Cheng*

## Bird and Habitat Balance Mobiles

**Grades:** Primary, Middle

**Objectives:** After completing this activity, students will be able to manipulate form and shape to construct two mobiles, the first representing contour and symmetry of birds in flight and the second illustrating the need to balance basic components in an ecosystem (ART), and identify birds based on silhouette shape as well as understand the concept of the health of an ecosystem is based on the balance of its various components (SCIENCE).

**Materials:**

- slides, photographs, decoys, and/or field guides
- black construction paper
- scissors
- glue
- straight wire or short straight sticks, 5-10" long
- fishing line
- white poster board or foam core board
- card stock paper

### Activity I: Bird Silhouette Mobile (Primary)

- 1) Hold a general discussion with students about mobiles - moving works of art that are created by suspending and balancing shapes. An American artist, Alexander Calder, who experimented with combinations of shapes and weights balancing each other, created the first mobile. Calder also discovered that the suspended objects move in a rotating fashion due to air currents. Explain that most birds can be identified by a general silhouette shape. Creating silhouettes can be helpful in learning to identify birds.
- 2) Divide the class into groups of five or six students. Distribute field guides and the list of Common Migratory Birds Species. Have each student select a species with a distinctive silhouette while in flight or in a stationary position. Encourage each student in each group to select a bird from each of the four species groups - waterfowl, raptors, shorebirds, and songbirds.
- 3) Have students sketch silhouettes of their birds on black construction paper paying attention to the overall dimensions and shapes of the body, head, neck, and the feet of the birds. Encourage students to add outline details of wing and tail feathers.
- 4) Have students cut out silhouettes and mount them on a square or circle of white poster board or foam core (a single circle or square could display two silhouettes depicting one side of the bird in flight, and one side depicting the bird in a perched position.)
- 5) Have students make a small hole in the top of the square or circle, attach fishing line for hanging, and attach the silhouettes to the horizontal wires. Have them begin with the shorter lengths of wire at the bottom of the mobile and progress to the longer lengths at the top. Balance each section as it is assembled. Each wire can contain a single object at both ends, or a single object on one end balanced with a shorter balanced wire (containing two objects) on the other end.
- 6) When mobiles are completed, have students hang them where they can catch air currents.

## Activity II: Habitat Balance Mobile (Middle)

- 1) Review birds' habitat requirements for food, shelter, water, and space (see *Habitat is Where It's At* section overview). Can students describe the habitat needs of the birds they selected for their bird silhouette mobiles?
- 2) Tell students they will be creating a physically well-balanced mobile to depict the specific habitat of one bird represented in the bird silhouette mobile.
- 3) Cluster students into groups and have each group select one bird. Have the groups create lists of all the things the bird needs to survive in its habitat including its specific requirements for food, water, shelter, and space. Groups' lists may vary greatly from one another depending on the bird selected by the group. Waterfowl will require marsh grass, water, and a wide variety of food substances, including phytoplankton, aquatic plants, small fish, etc. (every species of duck has different food requirements), while songbirds will require trees, worms, insects, berries, grubs, etc. (every songbird has different food requirements.)
- 4) Distribute old magazines, pens, crayons, magic markers, or other drawing materials. Have each group clip pictures from the magazines or create new pictures to represent the varied items birds need to survive.
- 5) Once groups have created, or gathered representative images, of all the things their bird needs to survive, have them adhere pictures to poster board and cut out poster board shapes. Now have students follow the procedure outlined in Activity I, steps 4 and 5, to construct their second mobile.
- 6) Explain that the most important aspect of the habitat mobile is that it is well-balanced, just as healthy ecosystems must be well-balanced. Ask students to describe what they think will happen if one element of the mobile is removed. Ask them to describe verbally how balance or imbalance of their habitat mobile relates to the health of ecosystems.

### Evaluation

Did students' bird silhouette mobiles reflect mastery of elements of contour, shape, and symmetry? Did the habitat mobile represent an understanding of balance as it relates to healthy ecosystems?

*Art by E. Laplante*

# CONTINUING the CONSERVATION JOURNEY

Migratory waterfowl and other migratory birds have often been likened to "canaries in the mine shaft." In this familiar metaphor, miners sent canaries into the mine shaft to help provide an indicator of the depth at which sufficient oxygen was present for the miners to work. Similarly, migratory birds are key indicators of biological diversity and shifts in bird populations reflect overall changes in the health of the ecosystems on which they depend. Migratory waterfowl, raptors, shorebirds, and songbirds require healthy ecosystems throughout their migratory range in the Western Hemisphere. Protecting these species requires conservation efforts at all levels - local, state, regional, national, and international.

*Art by B. Gomes*

Fortunately, much can be done to help protect migratory waterfowl and other migratory birds. Teachers and students working together in school or outreach educational settings can do many things. First and foremost, we encourage you to participate in the Junior Duck Stamp Conservation and Design contest by entering your class in your state contest. Second, make use of the Junior Duck Stamp curriculum as a means to link up with other conservation outreach programs such as International Migratory Bird Day, National Wildlife Refuge Week, National Wetlands Week, and others. Third, use the materials as a springboard to a number of other "action-based" conservation education activities, such as schoolyard habitat restoration and

nest-box building projects. Finally, encourage students to extend their understanding of migratory birds and to become even more active conservation stewards by conducting any one or a number of the following Conservation, Imagination and Stamp Activities described in this section.

## Conservation, Imagination and Stamp Activities to Continue the Journey

### **International Migratory Bird Day (IMBD)** (<http://birds.fws.gov/imbd>)

IMBD is celebrated annually on the second Saturday in May to coincide with the return of migratory birds to their breeding grounds and raise awareness of the need for conservation of their habitats. Many teachers make use of IMBD as an opportunity to display artwork and other products that students have produced through their participation in the Junior Duck Stamp curriculum. IMBD can serve as a wonderful culminating event for your Junior Duck Stamp unit, and you may wish to integrate an IMBD school festival into your Junior Duck Stamp Program. To learn more about IMBD events and programs, obtain the IMBD Organizers' Packet and IMBD Educators' Supplement.

### **National Fishing Week**

National Fishing Week is geared toward raising awareness of the importance of fisheries, watersheds, and wetlands. It is a multi-agency event in which the U.S. Fish and Wildlife Service is a main partner. National Fishing Week is celebrated annually the first week of June. Although National Fishing Week occurs right at the end of the school year, you may wish to integrate observation of National Fishing Week with one of the wetlands-focused activities in the Junior Duck Stamp curriculum.

### **National Wildlife Refuge Week (NWRW)** (<http://refugedata.fws.gov>)

National Wildlife Refuge Week is celebrated annually the second week in October. The goals of NWRW are to raise awareness of the rich diversity of wildlife and habitats included in the National Wildlife Refuges and the importance of conserving refuges. National Wildlife Refuges serve as wonderful outdoor living laboratories and most have excellent interpretation and education programs geared to students. Most refuges celebrate NWRW during which education and outreach activities are enhanced. Observing National Wildlife Refuge Week by highlighting the importance of refuges to migratory waterfowl and other migratory birds could be an excellent extension activity to include in your Junior Duck Stamp curriculum.

### **Design a Schoolyard Wetland or Other Habitat** ([www.nwf.org](http://www.nwf.org))

Waterfowl and other migratory birds benefit from even the smallest areas of restored habitat. Ask students to consider the ways in which your schoolyard or backyard could be enhanced for waterfowl (or other wildlife) including possible needs for additional water sources, food, and shelter. Then have them employ elements of design to create a schematic layout of an enhanced habitat at the chosen site. First have them create an illustrated map of what your schoolyard currently looks like. Then have them consider all the ways they could improve your schoolyard's "habitat" and create a second map that portrays a more ideal habitat for waterfowl or other migratory birds. This could be considered an exercise in "landscape design" in which students integrate the beneficial habitat components, such as water sources, feeding stations, areas of cover, etc., into a map of your existing school site. Restoring an area of your schoolyard to provide habitat for birds can also provide an excellent outdoor classroom. This project could be expanded to include cross-curricular teaching activities for your school

### **Develop a Nest Box, Bird House, and/or Bird Feeding Station Project**

Some bird species are cavity nesters, requiring holes in dead trees in which to nest. These species, including wood ducks and blue birds, have benefited from the availability of nest boxes. Others, such as house wrens and purple martins benefit from bird houses. Most (but not all) birds benefit from feeding stations. Have students research appropriate designs and build a nest box, bird house, or bird feeding station. This could be conducted in conjunction with a vocational education program. You may also wish to conduct a contest in which students compete to create award-winning nest box, bird house, or feeder designs.

### **Bird Buttons**

Buttons are popular with both children and adults. Teach students about migratory birds by having them select a particular bird species from which they will design and make a button. Provide students with a pre-cut circle of card stock on which they will create an illustration of their species. They may wish to include the bird's common and scientific name and any other information they want to communicate about the bird. When students have completed their illustrations, have the card stock laminated and attach a pin to it with glue. Students may wish to make a collection of bird buttons and/or trade them with other students. As a class you could provide a set of bird buttons as a gift to a classroom in another state or country. Bird bookmarks could be made using the same basic procedure with rectangular bookmark shaped card stock.

*Art by A. Bigda*

## Cartoons and Bumper Stickers - Communicating with Humor

Humor may be one of the best ways to communicate information about important topics. Bumper stickers and cartoons are two means by which popular media makes use of humor to communicate messages. Have students consider all that they have learned about waterfowl and other migratory birds and the need for conservation of their habitat. Have them write quick, short messages they would want to communicate about these issues. Then have students design either a cartoon or a graphically illustrated bumper sticker that communicates these messages. You may wish to exhibit students cartoons in a visible location in your school. Many print shops are now able to produce bumper stickers at a low cost.

## Alice in Waterland

Explore different bodies of water, and try to identify various aquatic wildlife present in each one. Have students make simple "water scopes" using the following techniques:

- using a can opener, remove both ends of a juice can
- carefully tape the sharp edges so you don't cut yourself
- stretch a piece of clear plastic wrap tightly over one end of the can, overlapping on all sides
- put an elastic band around the end of the can so the plastic wrap is held tightly in place
- trim edges of the plastic to make them even and then tape them down with waterproof tape
- test your water scope in a basin of water
- lower plastic wrap end into the water making sure the open end never goes below the water.

Now visit a nearby pond or marsh, look through the open end of the scope and see for yourself what lurks below the watery surface.

## Banquet for Birds

Have students research the food preferences of a variety of birds that breed in your area. Provide the basic ingredients, such as millet, sunflower seed, corn, etc., and swatches of remnant cloth. Instruct students to make up sample seed satchels by creating the appropriate seed mix. Then have them pour just enough onto a piece of cloth. Gather the cloth up at the edges and tie a piece of yarn around the top. Last, have students prepare small gift cards indicating for what species the seed mix is appropriate and the basic ingredients of the seed mix. The satchels can then be given as gifts to parents, other classes, or senior centers, used at boys and girls clubs, or provided for holiday benefit sales.

*Art by D. Cheng*

## Plaster Casts

Plaster casts are a great way for students to get "up close and personal" with animal tracks. Have students practice with plaster casting techniques by developing a cast of a leaf. Have them press a leaf into a thin slab of damp plaster in a cardboard box. Make a good impression then remove the leaf. Poke a hanging hole in the top with a pencil. Now visit a local natural area and search for tracks of birds or other animals. Make casts using basic casting techniques as directed on bags of Plaster of Paris.

## Bird Origami

Birds are found throughout Japanese art including origami, the ancient Japanese art form of paper folding. Obtain an origami design book and copy several of the origami designs of birds for students to try. Have students make their origami birds in many different colors of origami paper. When students have completed their birds, you may wish to make an origami mobile following the mobile construction technique outlined in Bird and Habitat Mobile.

## Edible Birds

Have students select a bird that has become a favorite through their work in the Junior Duck Stamp Program. Have them create a stencil of this bird by cutting out a line drawing on cardboard. Make rolled dough cookie batter such as sugar cookies or short bread. Have students cut out shapes of their bird by pressing their stencils into the dough and cutting around the stencil with a dinner knife. Cook cookies; have students present their "cookie birds" stating one piece of information about its natural history, and enjoy a class bird cookie feed.

## Bird Stained Glass

Stained glass is a wonderful way to convey concepts of color, intensity, and hue. Have students identify a bird for which they would like to make a stained glass construction. Have them identify colorful birds that would lend themselves to stained glass. Work with a vocational education program or shop class to produce the stained glass.

*Art by B. Jinson*

## Crazy Critters

Tell students they will be making a three-part bird. Have them fold a piece of paper into three equal sections. The first student will draw a picture of a bird's head on the first section making sure that the bird's neck extends to the second section. The second student draws a body without looking at the head. The third student draws the bird's legs and feet without looking at the other sections. Have students unfold their drawings and give their Crazy Critter a name.

## Notable Quotables

Have students create drawings from any one of the following quotations and topics. "Duck soup," "You're a dead duck," "Sitting duck," "Tempus fugit," (time flies), "That's just ducky," "Walks like a duck," "Sounds like a duck," "Lame duck administration," "What's good for the goose is good for the gander," "You've cooked your goose," "Wild goose chase," "Graceful as a swan," "A little bird told me," "Egg head," "Which came first the chicken or the egg?" "She's an old crow," "He's batty," "A quack doctor," "He's an odd duck," "Feather in your cap," "Feather your nest," "Nesting instincts," "Feather weight," "Get your ducks in a row."

## Totem Poles

Have students draw small one-to-two inch square images of bird species that have become their favorites during the Junior Duck Stamp Program. Then have them glue them to a tube taken from the inside of a paper towel roll. Add feathers and geometric Native American designs to the pole.

## **Flying Machines**

Have students list all the things they can think of that fly. Airplanes, bats, birds, kites, hot air balloons, gliders, helicopters, hand gliders, baseballs, and butterflies are a start. Have students create a mural with images of these flying machines. Then discuss the similarities in shape and design that helps keep them aloft.

## **Bird Headdresses**

Have students research the headdresses and helmets in art books on pre-Columbian Mayan and Aztec, American Indian, Egyptian, Greek, Roman, African, Eskimo, medieval, and contemporary helmets. Have them select a bird species they would like to represent and design an original headdress for themselves. Contact a local costume or performing arts store for artificial feathers. Use this as an opportunity to discuss the marketing of feathers from water birds to supply the millinery trade in the early part of the twentieth century. Waterbird populations plummed as a result of the huge demand for plumes resulting in the establishment of the first National Wildlife Refuge and National Audubon Society.

## **Stamps and Stamp Collecting**

Stamps and stamp collecting represent an interesting and rich tradition in the United States. Make sure students understand the distinction between Federal Duck Stamps, regular postage stamps, and commemorative stamps. Federal Duck Stamps must be purchased by hunters to accompany their state hunting licenses. They are revenue stamps, not postage stamps. Proceeds from Federal Duck Stamp sales are used to purchase wetlands. Duck stamps are printed on a one time only basis and not reprinted after the first run is sold out. All unsold stamps are destroyed after three years. These represent some of the more novel designs among the stamp collecting world. You may want to show students a series of Federal Duck Stamps and winning Junior Duck Stamps from years past. (<http://duckstamps.fws.gov> or purchase at [www.usps.com/jds](http://www.usps.com/jds))

## **Neighbors, friends, and relatives are a good source for stamps**

Office mail may be even better. Tell students to be very careful when handling stamps. Most collectors go to great pains to protect stamps from greasy fingers, food and drink spills, and fading from direct sunlight.

## **Stamp Design Mural**

Cover a table with white butcher paper and outline several stamps (perforations only) with black marker. Have students select waterfowl species and draw waterfowl stamp designs directly on the paper. The finished paper can be used for a mural on the wall.

# RESOURCES

## Glossary

**adaptation** - a trait that improves a plant's or animal's ability to live in a particular environment.

**avian** - of, or relating, to birds.

**bird banding** - research technique in which a small aluminum band is attached to a bird's leg. If the bird is captured again or found dead, and if the band number is reported to the responsible federal agency, the bander and other researchers can learn about avian movements and longevity.

**breeding grounds** - environment where an animal mates and produces offspring.

**brood** - the birds that hatch from a single clutch of eggs.

**camouflage** - a genetically controlled pattern or marking that protects an individual organism.

**carnivore** - a flesh eating animal, or any of an order of mammals, that feeds mostly on animal flesh.

**clutch** - the number of eggs laid by a female bird in one nesting.

**conservation** - the use of natural resources in such a way that ensures their continuing availability.

**culture** - the arts, beliefs, and traditions of a particular population of a region or country.

**docent** - teacher, or lecturer, often at a museum.

**ecology** - the science of the relationships between living organisms and their environments.

**ecosystem** - all living and nonliving things within an area that are all linked together by energy and nutrient flow.

**endangered species** - a species which is in danger of extinction throughout all or a significant portion of its range.

**environment** - conditions in an area influenced by the climate, soil, topography, and living components in an area.

**estuary** - an arm of the sea at the mouth of a river.

**extinction** - no longer existing.

**fat loading** - build up of fat reserves by a bird before migration.

**fledgling** - a young bird that has recently left the nest, has feathers, and still depends on its parent for food.

**flyways** - general routes of travel used by birds when migrating between breeding and wintering grounds. Four major flyways are Atlantic, Mississippi, Central, and Pacific.

**forage** - to search for food.

**fragmentation** - division of large continuous tracts of habitat into smaller areas.

**geography** - study of the earth and its features and of the distribution of life on the earth.

**habitat** - the place where an animal makes its home and meets all its needs for survival. Components of a habitat are food, water, shelter, and space.

**instinct** - a natural impulse or motivation arising from within.

**inventory** - a detailed list of items or the process of making a list of items.

**marsh** - a tract of soft, wet land.

**migration** - movement of a species from one place to another, often following a change of season.

**molt** - the shedding of feathers by a bird.

**navigate** - to follow or plan a course across or through to a destination.

**neotropical** - the area of the Americas which lies between the Tropics of Cancer and Capricorn.

**neotropical migratory bird** - a bird that moves seasonally between temperate or mild climate regions of North America (where it nests), and warm tropical areas of Mexico, the Caribbean and other parts of Latin America (where it waits out the northern winter months.)

## Glossary continued

**nonbreeding grounds** - environment where an animal spends the winter, also referred to as the wintering grounds.

**orientation** - location or position relative to the points of a compass.

**ornithologist** - one who engages in the scientific study of birds.

**photoperiodism** - seasonal response by organisms to change in length of the daylight period.

**population** - group of individuals of a particular species in a given area.

**prairie** - a broad tract of level or rolling grassland.

**predator** - an animal that kills and eats other animals.

**preening** - to dress or smooth up; to trim or dress with the beak.

**preservation** - maintenance of a natural environment undisturbed by the influence or activities of humans.

**prey** - an animal that is killed and eaten by other animals.

**range** - land upon which animals live.

**raptor** - a bird of prey, such as an hawk or owl.

**resident bird** - a bird that does not migrate, but makes its home in the same place and climate all year.

**riparian** - bordering water; at the water's edge; the water influence zone. "Riparian area or Riparian Zone" refers to the vegetation that grows on or near the banks of streams, rivers, lakes, and other bodies of water.

**shelter** - provides protection or cover from the weather.

**shore bird** - a bird that frequents coastal or inland shores.

**shrub land** - land covered by shrubs, or woody plants that are usually relatively short, and differ from trees by having several stems instead of a single trunk.

**species** - a population of individuals that are more or less alike and are able to breed and produce fertile offspring under natural conditions.

**swamp** - wet, spongy land.

**temperate** - area of the earth that lies between the tropical and polar regions and has a mild climate.

**topography** - physical features of a place or region.

**vegetation** - mass of plants that covers a given area.

**waterfowl** - a swimming bird, such as a duck, goose, or swan, usually frequenting freshwater areas. Swimming game birds as a group.

**wetlands** - land frequently covered by water.

**wildlife** - animals in their natural environments. Wild animals and vegetation, especially animals living in their natural undomesticated state.

**woodland** - land covered by trees; refers to a more open arrangement than a forest.

# FEDERAL JUNIOR DUCK STAMP CONSERVATION & DESIGN PROGRAM RESOURCE LIST

## Web Sites and Internet Connections

### **U.S. Fish and Wildlife Service ([www.fws.gov](http://www.fws.gov))**

Visit the U.S. Fish and Wildlife Service's World Wide Web site in order to view the home pages of any of the following Service divisions: • Federal Duck Stamp Office and Federal Junior Duck Stamp Home Pages, • Office of Migratory Bird Management Home Page, • Division of Refuges Home Page, • North American Waterfowl Management Plan Home Page.

### **MassWildlife ([www.masswildlife.org](http://www.masswildlife.org))**

Provides information on the Junior Duck Stamp as well as other statewide programs.

### **Spellman Museum of Stamps and Postal History ([www.spellman.org](http://www.spellman.org))**

Engages diverse audiences with opportunities to learn from stamps & postal history. Has a philatelic research library.

### **Partners in Flight ([www.pwrc.nbs.gov/pif](http://www.pwrc.nbs.gov/pif))**

Provides interagency clearing house for migratory bird programs.

### **Waterfowl Identification in the Central Flyway ([www.npsc.nbs.gov](http://www.npsc.nbs.gov))**

Aids sportsmen in waterfowl identification.

### **Ducks at a Distance ([www.npsc.nbs.gov](http://www.npsc.nbs.gov))**

Aids sportsmen in waterfowl identification.

### **Western Hemisphere Shorebird Reserve Network**

([www.npsc.nbs.gov/resource/tools/birdhouse/birdhouse.htm](http://www.npsc.nbs.gov/resource/tools/birdhouse/birdhouse.htm))

Provides information on shorebird reserve sites, handbook, events, and image gallery.

### **Journey North ([www.learner.org](http://www.learner.org))**

Provides on-line studies in the phenomenon of migration and allows students to track actual migration of various species, including migratory birds, using current data provided by practicing scientists. May have to go through "search" to get to Journey North on site.

### **Project WILD ([www.projectwild.org](http://www.projectwild.org))**

Includes general information and lesson plans from this interdisciplinary, environmental education program. Provides information on educator training in every state. In MA visit [www.masswildlife.org](http://www.masswildlife.org) for local workshop info.

### **National Fish and Wildlife Foundation ([www.nfwf.org](http://www.nfwf.org))**

Offers information about existing programs including the Neotropical migratory bird program and International Migratory Bird Day.

### **Ducks Unlimited ([www.ducks.org](http://www.ducks.org))**

Provides information on existing program and useful information gleaned from Ducks Unlimited bi-monthly magazine. Massachusetts Ducks Unlimited ([www.ducommunity.org](http://www.ducommunity.org))

### **National Audubon Society ([www.audubon.org](http://www.audubon.org))**

Web site emphasizes Audubon's programs that rely on contributions from volunteers including students.

**Cornell Laboratory of Ornithology ([www.ornith.cornell.edu](http://www.ornith.cornell.edu))**

General information on laboratory's programs.

**"Strictly for the Birds,"** Oxford Science Films, Survival Series, New York, NY

**"Wonders on the Wing,"** video which accompanies Wonders on the Wing instructional guide, Colorado Division of Wildlife, 6060 Broadway, Denver, CO 80216.

**"Singing in the Rainforest," "For the Birds - Comeback of the Peregrine Falcon," "Birders of a Feather; Birders Moving from Canada to Costa Rica," "Night Moves - the Migration of Burrowing Owls,"** Missing Links Productions Inc. #400, 119 14th Street, NW, Calgary, Alberta, Canada T2N 1Z6.

**"The Loons of Golden Pond,"** the Company for Home Video Entertainment, 414 College Ave. P.O. Box 577, Woodstock, VT 05091.

**"The Video Guide to Stamp Collecting,"** Premiere Home Video, 6824 Melrose Avenue, Hollywood, CA 90036.

The films listed below are available on a free loan basis from the Philatelic Marketing Division, United States Postal Service, Washington, DC 20256-9994 & Audience Planners, Inc. 5107 Douglas Fir Road, Calabasas, CA 91302-1472.

**"America the Beautiful,"** relates recent stamp design to the natural beauty and scenic wonders of America.

**"Images of America,"** depicts a history of commemorative stamps, explains the selection procedure for stamp subjects, and conveys the spirit of an artist preparing original art work for a new stamp.

**"Stamps, A Nation's Calling Cards,"** discusses how stamps serve as a means by which a nation pays homage to those events and people that they wish to honor: great explorers, presidents, personalities, events, inventions, organizations, and animals.

## Slide Collections and Slide Shows

The Slide Collection of the U.S. Fish and Wildlife Service includes many single species images. Write to request use of images of specific species. Office of Public Affairs, 1849 C Street, NW, Washington, DC, 20240.

Vireo (Visual Resources for Ornithology) is a collection of 85,000 slides representing over 5,500 species of birds. Vireo sells and leases slides for lectures and publications. Vireo, The Academy of Natural Sciences, 1900 Benjamin Franklin Parkway, Philadelphia, PA 19103.

**Cornell Lab of Ornithology Slide Visual Services** For a catalogue of color slides of all North American Birds, contact Cornell Laboratory of Ornithology, 159 Sapsucker Woods Road, Ithaca, NY 14850.

**Partners in Flight Slide Show** Depicts problems facing Neotropical migratory birds and what can be done to help stem declines in populations. Available from Crows Nest Bookstore, Cornell Laboratory of Ornithology, 159 Sapsucker Woods Road, Ithaca, NY 14850.

**Birds in the Balance Slide Show** 60 slides and audio tape presentation. Convey issues of migratory bird conservation. National Audubon Society, Education Department, 700 Broadway, New York, NY 10003.

## Audio Tapes of Bird Songs and Calls

**Bird Songs and Calls** More than 25 different audio cassettes available. Crows nest, Cornell Laboratory of Ornithology, 159 Sapsucker Woods Road, Ithaca, NY 14850

**Know Your Birds: Sound Volumes I and II** Elliot Lang, North Sound, PO Box 1360 Minocqua, WI 54548.

**Peterson's Guides to Birding By Ear** Audio cassette or CD series with booklet. Wild Bird Centers of America stores or headquarters, Wild Bird Centers of America, 7370 MacArthur Boulevard, Glen Echo, MD 20812.

**"Peter and the Wolf"** Prokofiev, Serge. Recordings by Eugene Ormandy and the Philadelphia Orchestra; Vienna Philharmonic; New York Philharmonic with Leonard Bernstein. Contact music stores and local libraries.

**Nature Sounds** Land Elliott (617) 257-4995.

## Birds in Poetry

Birds, Adoff, J.B. Lippincott.

Bird Songs, Reed, Atheneum.

Bird Watch, Yolen, Philomel Books.

Feathered Ones and Furry, Fisher, Thomas Y. Crowell.

## Curricula

**Project WILD** An interdisciplinary, supplementary conservation and environmental education program emphasizing wildlife. Primarily for educators of K-12. Offers educator workshops. MassWildlife, 1 Rabbit Hill Road, Westboro, MA 01581. [www.masswildlife.org](http://www.masswildlife.org)

**Migratory Bird Curriculum Needs Assessment Project** Includes descriptions of over 100 migratory bird education programs, projects and materials including curricula and materials focused on waterfowl. Contact Sally Laughlin, Birds of Vermont Museum, PO 157, Cambridge, VT 05444. [www.birdsofvermont.org](http://www.birdsofvermont.org)

**US Fish and Wildlife Service Issue Pacs** Education pac produced by U.S. Fish and Wildlife Service, National Conservation Training Center on topics such as migratory birds, wetlands conservation and use, rivers and streams, freshwater marsh, urban areas and wildlife conflicts. Each provides factual information about the topic, habitat and resource management and a series of three lesson plans. National Institute for Urban Wildlife, Box 3015, Shepardstown, WV 25443.

**Teach about Geese** Teachers use relevant topics which motivate students and contribute to an education effort dedicated towards increasing goose populations and the awareness of wildlife management on the Yukon Delta Wildlife Refuge. Contact Yukon Delta NWR, PO Box 346, Bethel, AK 99559.

**Home for Pearl** Video and accompanying instructional guide explores issues of endangered species, habitat and habitat diversity. U.S. Fish and Wildlife Service Publications Unit.

**Journey North** Provides instruction on migration of various species including migratory birds via the Internet. Students write to species experts, track the migration of birds and other wildlife and learn ecological concepts. Journey North, 125 North First Street, Minneapolis, MN 55401. [www.learner.org/north](http://www.learner.org/north)

**Shorebird Sister Schools Project** Curriculum focuses on shorebird migration and allows students to track shorebirds as they move from nesting grounds in the Arctic to wintering grounds in Mexico and Latin America.

**International Crane Foundation** The foundation offers numerous curriculum packets including coloring books, activity booklets, study sheets, accompanying slide shows and more for grades K-12 and adults. Posters, books, photographs, films and slide shows also available. International Crane Foundation E-11376 Shady Lane Road, PO Box 447, Baraboo, WI 53913-0447. [www.savingcranes.org](http://www.savingcranes.org)

**National Audubon Society Educational Resources** Audubon adventures provides a set of 32 newspapers on migratory birds with teachers guide to be used in a classroom setting; teachers guides and posters. Education Division, National Audubon Society, 700 Broadway, NY, NY 10003. [www.audubon.org](http://www.audubon.org)

**Shorebird Migration Game Booklet** Includes lesson plans and game rules; ages 9-12. Manomet Observatory, Box 1770, Manomet, MA 02345. [www.manomet.org](http://www.manomet.org)

**The Songbird Blues Trunk** A comprehensive curriculum contained in a trunk. This mobile kit includes everything needed to teach a full unit on Neotropical migratory birds and their conservation. The trunk contains a teacher's guide, lesson plans, student research packets, puppets, felt boards, books, posters, audio and video tapes, and study skins. Songbird Blues, Montana Natural History Center, PO Box 8514, Missoula, MT 59807.

**The Songbird Connection** Videos, posters and multi disciplinary lessons offered on bird ecology and forest conservation for grades K-12. Contact Songbird Connection, New Jersey Conservation Foundation, 300 Medham Road, Morristown, NJ 07690.

**Wonders on the Wing** Video and accompanying curriculum on the natural history of migratory birds. Colorado Division of Wildlife, 6060 Broadway, Denver, CO 80216.

**Illinois Birds** Illinois Department of Conservation, 524 South 2nd Street, Springfield, IL 62701-1787.

**Project Feederwatch** A November through March project that involves participants watching and counting feeder birds. Cornell Laboratory of Ornithology, 159 Sapsucker Woods Road, Ithaca, NY 14850 [www.birds.cornell.edu](http://www.birds.cornell.edu)

**Ranger Rick's Nature Scope - Birds, Birds, Birds** Lesson plans focused on birds and habitat. One in a series of educational booklets. Nature Scope, National Wildlife Federation, 1400 Sixteenth Street, NW, Washington, DC 20036-2266.

**Gardening with Wildlife Kit** National Wildlife Federation Backyard Wildlife Habitat Program, National Wildlife Federation, 1400 Sixteenth St. NW. Washington, DC 20036-2266. [www.nwf.org](http://www.nwf.org)

## **BILINGUAL - SPANISH/ENGLISH**

**Birds without Borders** Project has developed lesson plans and materials in Spanish for use in bilingual classrooms in Colorado and schools in Mexico. Birds beyond Borders, Colorado Bird Observatory, 13401 Piccadilly Road, Brighton, CO 80601.

**Save Our Migratory Birds** This guide for middle school teachers provides a series of lessons and fact sheets that encourages students' global perspective on natural resources by focusing on birds which link countries through their seasonal migration. Save our Migratory Birds, Manomet Observatory, PO Box 1770, Manomet, MA 02345.

**Save Our Shorebirds** A teachers interdisciplinary guide to understanding shorebirds and their migration; upper elementary to middle school students and available in Spanish and English. Manomet Observatory, Box 1770 Manomet, MA 02345.

**Bird Quest** A program for all ages consisting of six levels of classroom and field instruction that lead students from basic bird identification to independent studies. Bird Quest, Canadian nature Federation, 1 Nicholas Street, Suite 520, Ottawa, Ontario, K1N 7B7.

## Periodicals

Nearly every state fish and wildlife agency produces a magazine focused on wildlife issues in the state. Many have excellent articles and reference materials on waterfowl and other migratory birds. Contact your state fish and wildlife agency to obtain current issues of their publications.

**Massachusetts Wildlife Magazine** Quarterly publication of informative articles & spectacular photographs. Massachusetts Wildlife, MassWildlife, 1 Rabbit Hill Road, Westboro, MA 01581.

**Ducks Unlimited** Bi-monthly publication of Ducks Unlimited. Ducks Unlimited, Inc. National Headquarters, One Waterfowl Way, Memphis, TN 38120.

**Puddler** Quarterly youth oriented publication of Ducks Unlimited, Ducks Unlimited, Inc., National Headquarters, One Waterfowl Way, Memphis, TN 38120.

**Waterfowl and Wetlands Magazine** Official quarterly publication of the South Carolina Waterfowl Association, SCWA 434 King Street, Charleston, SC 29403.

**Audubon** Bi-monthly publication of the National Audubon Society, Audubon, Membership Data Center, PO Box 2666, Boulder, CO 80322.

**Audubon Field Notes** Seasonal reports on population distribution of birds. Subscription includes the Christmas Bird Count issue. Field Notes, National Audubon Society, 700 Broadway, NY, NY 10003.

**Partners in Flight Newsletter** Reports on Partners in Flight conservation projects. Partners in Flight, National Fish and Wildlife Foundation, 1120 Connecticut Ave., NW, Suite 900, Washington, DC 20036.

**Ranger Rick, My Big Backyard, National Wildlife, International Wildlife** The four publications of the National Wildlife Federation. The first two are high quality children's nature magazines, the last two are aimed at a general audience and focus on wildlife issues. National Wildlife Federation 1400 Sixteenth Street, NW, Washington, DC 20036-2266.

**Falcon** Popular children's wildlife magazine featuring much useful information and fun activities. Falcon Magazine, PO Box 15936, North Hollywood, CA 91615-5936.

## Waterfowl and Wildlife Art Books

The Life and Lore of Birds in Nature, Art, Myth and Literature, Armstrong, E.A., Crown Publishers, Inc.

The Illustrator, Vol. 13, No.1, Art Instruction School Publication. 500 South Fourth Street, Minneapolis, MN.

Ducks of North America and the Northern Hemisphere, Gooders, J., Illustrated by Boyer, Trevor, 38 color plates of magnificent illustrations in winter and summer plumage.

The Illustrated Encyclopedia of Birds, Heintzelman, D., New Yoir, Winchester Press.

The Flame of Peace: A Tale of the Aztecs, Lattimore, D., Los Angeles, Harper Row,

The Artists' Magazine, "Secrets of Painting Waterfowl Reflections," Seslar, P., F and W Publications, 1507 Dana Avenue, Cincinnati, OH 41207.

## NORTH AMERICAN DUCKS, SWANS, AND GEESE

Fulvous Whistling Duck  
Black Bellied Whistling Duck  
Tundra Swan  
Trumpeter Swan  
Mute Swans are not permitted as they are not  
native to North America

Greater White-fronted Goose  
Snow Goose  
Ross Goose  
Brant  
Canada Goose  
Emperor Goose  
Wood Duck  
Green-winged Teal  
Blue-winged Teal  
Cinnamon Teal  
American Black Duck  
Mottled Duck  
Mallard  
Northern Pintail  
Northern Shoveler  
Gadwall  
American Wigeon  
Canvasback

Redhead  
Ring-necked Duck  
Greater Scaup  
Lesser Scaup  
Common Eider  
King Eider  
Spectacled Eider  
Steller's Eider  
Harlequin Duck  
Oldsquaw  
Black Scoter  
Surf Scoter  
White-winged Scoter  
Common Goldeneye  
Barrows Goldeneye  
Bufflehead  
Hooded Merganser  
Common Merganser  
Red-breasted Merganser  
Ruddy Duck

Hawaiian species permitted in Junior Duck Stamp  
Competition: Nene Goose, Koloa, Laysan Duck

**Please note: loons are water birds, not waterfowl and are, therefore, not permitted in contest.**

# COMMON MIGRATORY BIRD SPECIES

## Waterfowl

Mallard  
Black Duck  
Pintail  
Shoveler  
Gadwall  
American Wigeon  
Blue-winged Teal

Upland Sandpiper

# UNITED STATES STATE BIRDS AND CANADIAN PROVINCIAL BIRDS

## United States

Alabama	Yellow Shafted Flicker
Alaska	Willow Ptarmigan
Arizona	Cactus Wren
Arkansas	Northern Mockingbird
California	California Quail
Colorado	Lark Bunting
Connecticut	American Robin
Delaware	Blue Hen
Florida	Northern Mockingbird
Georgia	Brown Thrasher
Hawaii	Nene Goose
Idaho	Mountain Bluebird
Illinois	Northern Cardinal
Indiana	Northern Cardinal
Iowa	American Gold Finch
Kansas	Western Meadowlark
Kentucky	Northern Cardinal
Louisiana	Brown Pelican
Maine	Black-capped Chickadee
Maryland	Baltimore Oriole
Massachusetts	Black-capped Chickadee
Michigan	American Robin
Minnesota	Common Loon
Mississippi	Northern Mockingbird
Missouri	Eastern Bluebird
Montana	Western Meadowlark
Nebraska	Western Meadowlark
Nevada	Mountain Bluebird
New Mexico	Roadrunner
New Hampshire	Purple Finch
New York	Eastern Bluebird
New Jersey	American Goldfinch
North Dakota	Western Meadowlark
North Carolina	Northern Cardinal

Ohio	Northern Cardinal
Oklahoma	Scissor-tailed Flycatcher
Oregon	Western Meadowlark
Pennsylvania	Ruffed Grouse
Rhode Island	Rhode Island Red
South Dakota	Ring-necked Pheasant
South Carolina	Carolina Wren
Tennessee	Northern Mockingbird
Texas	Northern Mockingbird
Utah	California Gull
Vermont	Hermit Thrush
Virginia	Northern Cardinal
Washington	American Goldfinch
West Virginia	Northern Cardinal
Wisconsin	American Robin
Wyoming	Western Meadowlark

## Canada

Alberta	Great Horned Owl
British Columbia	Steller's Jay
Manitoba	Great Gray Owl
New Brunswick	Black-capped Chickadee
Newfoundland	Atlantic Puffin
Northwest Territories	Gyr Falcon
Nova Scotia	Osprey
Ontario	Common Loon
Prince Edward Island	Blue Jay
Quebec	Snowy Owl
Saskatchewan	Sharptailed Grouse
Yukon Territory	Common Raven

## MIGRATORY BIRDS LISTED AS ENDANGERED

The more highly migratory species are denoted by capital letters.

Parentheses are used to indicate subspecies of a more widely distributed species.

Blackbird. Yellow-shouldered	Pigeon. (Puerto Rican) Plain
Caracara. (Audubon's) Crested	PLOVER. PIPING
Condor. California	PLOVER. WESTERN SNOWY
Coot. Hawaiian	Rail. (California) Clapper
Crane. (Mississippi) Sandhill	Rail. (Light-footed) clapper
CRANE. WHOOPING	Rail. (Yuma) clapper
CURLEW. ESKIMO	Scrub-Jay, Florida
Duck. (Hawaiian) Laysan	SHEARWATER. NEWELL'S TOWNSEND'S
EIDER. SPECTACLED	Shrike. (San Clemente) Loggerhead
FALCON. AMERICAN PEREGRINE	Sparrow. (Cape Sable) Seaside
Falcon. Northern Aplomado	Sparrow. (Florida) Grasshopper
Flycatcher. (Southwestern) Willow	Sparrow. (San Clemente) Sage
Gnatcatcher. (Coastal) California	Stilt. Hawaiian
GOOSE. ALEUTIAN CANADA	STORK. WOOD
Goose. (Hawaiian) Nene	Tern. (California) Least
Hawk. Hawaiian	TERN. LEAST
Hawk. (Puerto Rican) Broad-winged	TERN. ROSEATE
Hawk. (Puerto Rican) Sharp-tailed	Towhee. (Inyo) California
Moorhen. (Hawaiian) Common	VIREO. BLACK-CAPPED
Moorhen. (Mariana) Common	VIREO (LEAST) BELL'S
MURRELET. MARBLED	WARBLER. BACHMANS
Nightjar. Puerto Rican	WARBLER. GOLDEN-CHEEKED
Owl. (Mexican) Spotted	WARBLER. KIRTLAND'S
Owl. (Northern) Spotted	Woodpecker. Ivory-billed
PELICAN. BROWN	Woodpecker. Red-cockaded
PETREL. HAWAIIAN DARK-RUMPED	

\* These species protected under the Migratory Bird Treaty Act, are listed as endangered.  
U.S. Fish and Wildlife Service. Office of Migratory Bird Management. 1996.

# FAMOUS BIRD ARTISTS AND THEIR WORKS

## Examples of Artists Who Have Birds in their Art

John James Audubon (1785-1815) American	Winslow Homer (1836-1910) American
Giacomo Salia (1871-1958) Italian	Paul Klee (1879-1940) Swiss
Pieter Bruegel (1525-1569) Belgium	Nicholas Maes (1623-1693) Dutch
Mary Cassatt (1844-1926) American	Claude Monet (1840-1926) French
Henry Moore (1898-1986) English	Roger Tory Peterson (1908-1996) American
David Smith (1906-1965) American	Pablo Picasso (1881-1973) Spanish
Gerard Dou (1613-1675) Dutch	Henri Rousseau (1844-1910) French
Thomas Gainsborough (1727-1788) English	Peter Paul Rubens (1577-1640) Dutch
Paul Gauguin (1848-1903) French	George Seurat (1858-1891) French
Morris Graves (1910-2001) American	Frans Snyders (1579-1657) Dutch
Fran Hals (1580-1666) Dutch	Vincent Van Gogh (1853-1910) Dutch
William M. Harnett (1848-1892) American	Johannis Verspronck (1597-1662) Dutch

## Sculptors Inspired by Birds

Jean Hans Arp, (1886-1966), French - "Flight of the Birds," 1930; "Leaf or Bird," 1959; "Bird Skeleton," 1952; "Winged Configuration," 1925; and "Bird Masquerade, 1964. Abstract shapes and forms.

Constantin Brancusi, 1876-1957), Rumanian -"A Bird in Space," 1924. Suggests the essence of a bird's sudden upward movement through space. An extended and simplified ovoid form.
